

# ***Approach to leukocytosis and leukopenia***

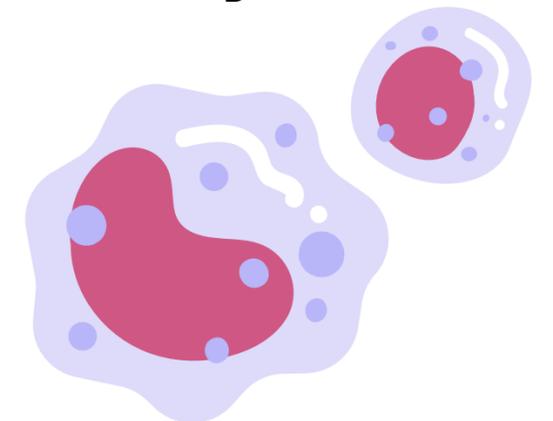

**Yaqeen Alathameen  
Rana Khattab  
Shahed Mahamoud**

***Dr. Mohammed AbuFara***

# WBCs

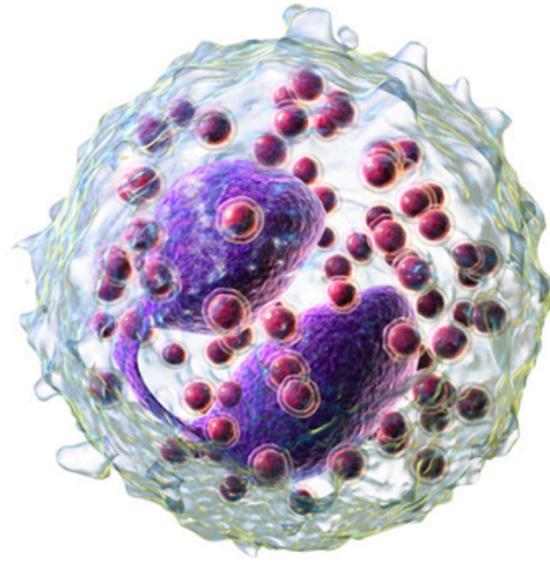

Our body is made up different types of blood cells, including white blood cells (WBC), or leukocytes.

- WBC are important part of our immune system, helping our body to fight off diseases and infections.
- Normal WBC count is 4.500–11.000/mm<sup>3</sup> in adult man.
- Normal WBC count ranges vary based on an individual's age, pregnancy status, sex, and ethnicity, and on the laboratory performing the study.

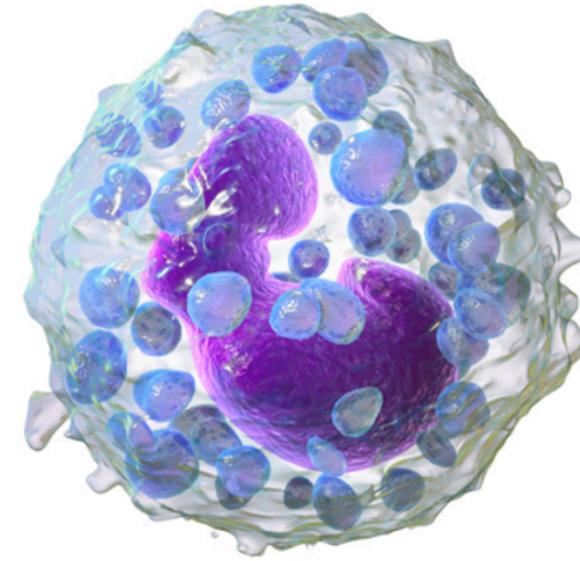

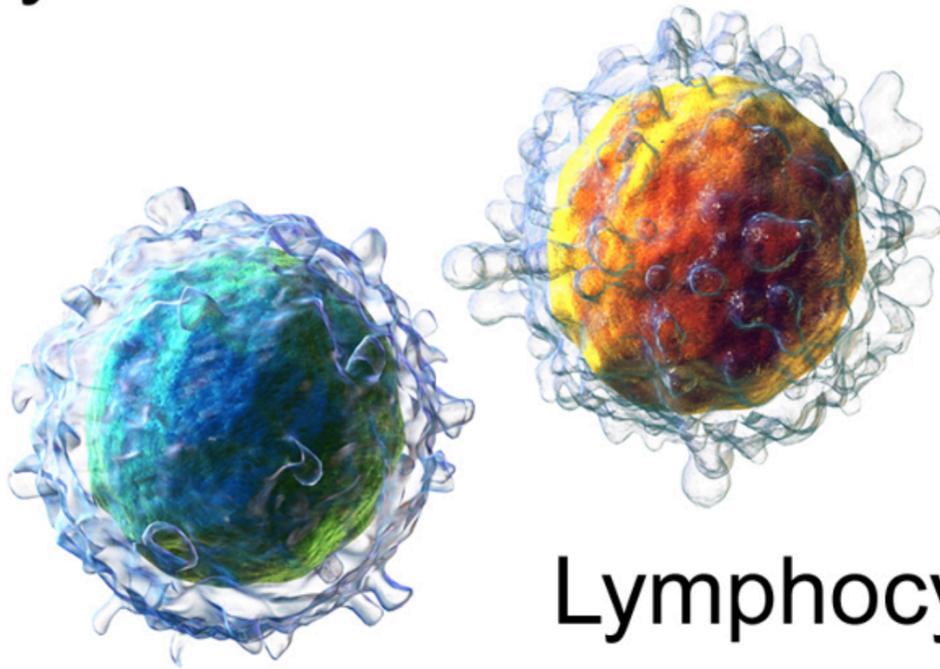

Monocyte

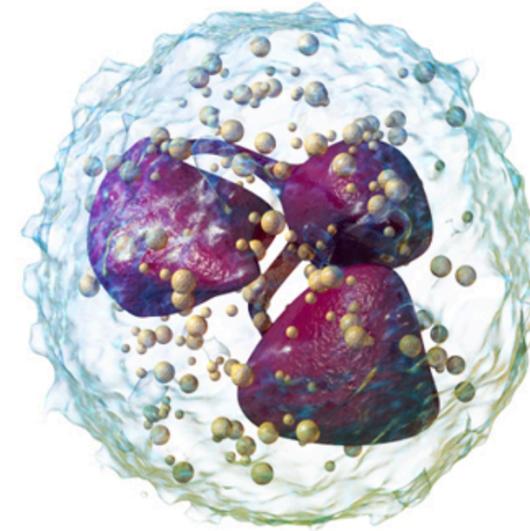

Eosinophil

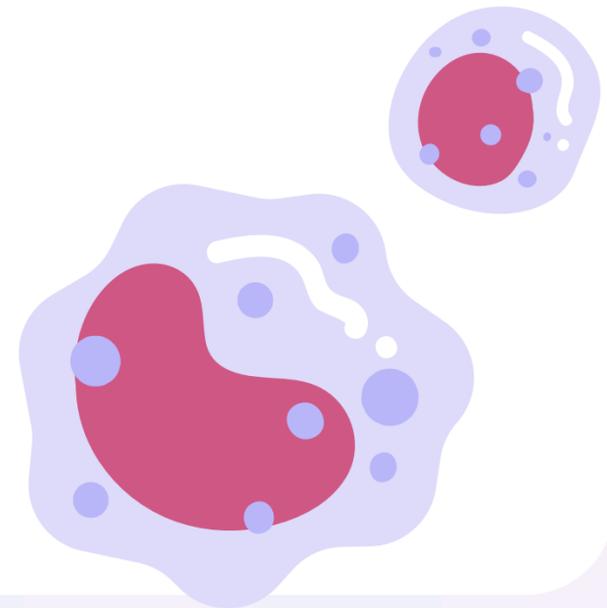

Basophil

Lymphocytes

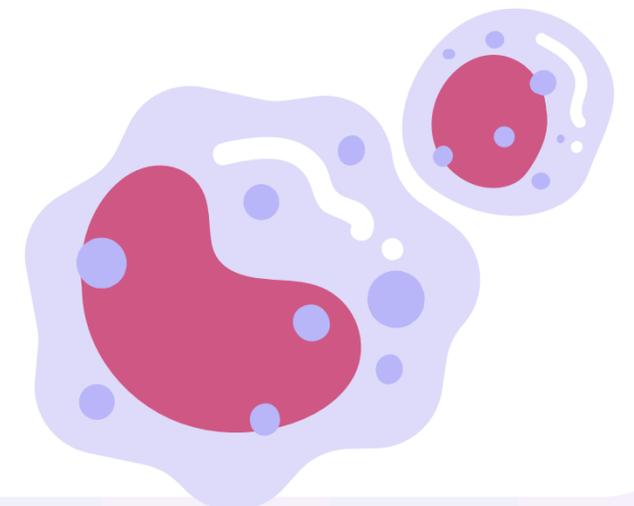

Neutrophil

# **Leukocytosis**

Leukocytosis is an **increase** in the white blood cell (WBC) count ( $>11,000/\text{mm}^3$ ).

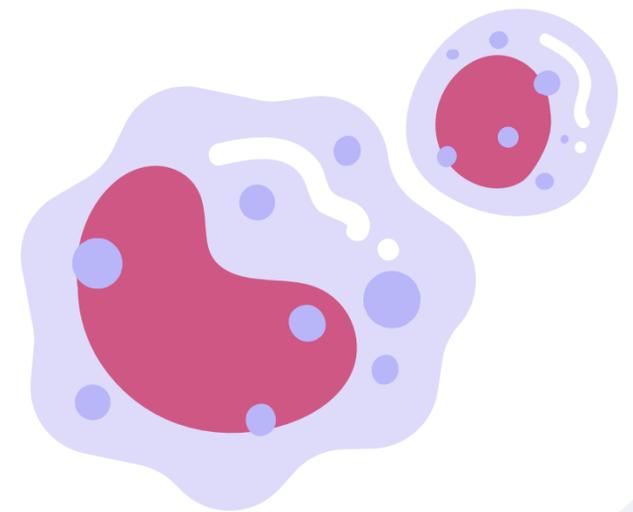

- Which can be further characterized by the predominating cell type, e.g., neutrophilia, lymphocytosis, eosinophilia .
- This condition can occur for various reasons and is often an **indication that the body is responding to** an infection, inflammation, or other underlying medical conditions.
- Leukocytosis can be **categorized into several types**, depending on which specific type of white blood cell is elevated :
  - 1) Neutrophilic leukocytosis
  - 2) Monocytic leukocytosis
  - 3) Lymphocytic leukocytosis
  - 4) Eosinophilic leukocytosis
  - 5) Basophilic leukocytosis

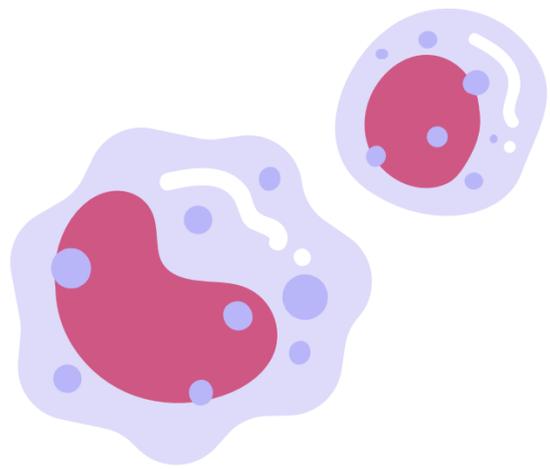

## **1- Neutrophilic leukocytosis:**

**Is an increase number of neutrophil in differential leukocytic count which normally (60-70%).**

**# Common causes of neutrophilia:**

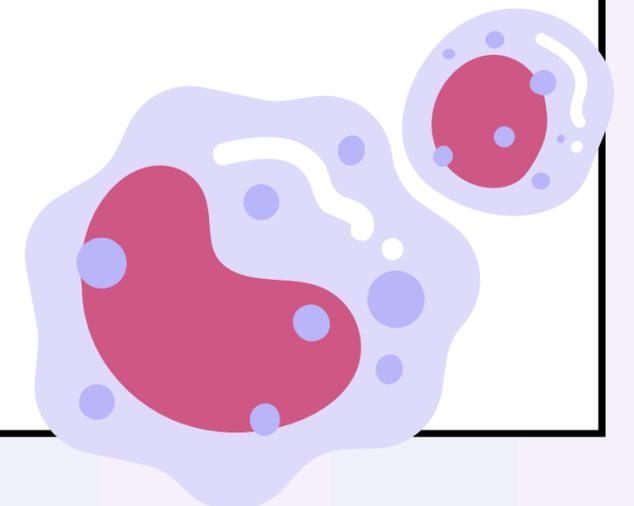

condition	Infection	Stress response
<b>clinical features</b>	<ul style="list-style-type: none"> <li>• <b>Feve</b></li> <li>• <b>Features specific to infection site</b>, e.g : Cough, shortness of breath, dysuria , New heart murmur</li> </ul>	<ul style="list-style-type: none"> <li>• Recent physical stress (e.g., surgery, seizure, vigorous exercise)</li> <li>• Recent emotional stress (e.g., panic attack)</li> </ul>
<b>dignostic finding</b>	<ul style="list-style-type: none"> <li>• Neutrophil left shift</li> <li>• Body fluid cultures with bacteria or fungus</li> <li>• Imaging (e.g., CXR) consistent with infection</li> </ul>	<p>Reactive neutrophilia</p> 

condition	Acute myeloid leukemia	Chronic myeloid leukemia	Myeloproliferative neoplasm
clinical features	<ul style="list-style-type: none"> <li>• Sudden onset and rapid progression of symptoms .</li> <li>• <b>Fatigue, pallor, weakness</b> .</li> <li>• Epistaxis, <b>bleeding</b> gums,petechiae, purpura</li> </ul>	<ul style="list-style-type: none"> <li>• Weight loss, fever, night sweats, fatigue</li> <li>• Splenomegaly, LUQ discomfort, infections.</li> </ul>	<ul style="list-style-type: none"> <li>• Constitutional symptoms, especially fatigue</li> <li>• Abdominal pain</li> <li>• Features of hyperuricemia, e.g., gout</li> </ul>
dignostic finding	<p><b>CBC and blood smear:</b></p> <ul style="list-style-type: none"> <li>• Anemia</li> <li>• Thrombocytopenia</li> <li>• &gt; 20% myeloblasts</li> <li>• <b>Bone marrow aspiration and biopsy</b></li> </ul>	<p><b>CBC and blood smear:</b></p> <ul style="list-style-type: none"> <li>• Sever leukocytosis</li> <li>• Thrombocytosis</li> <li>• Anemia later stages</li> <li>• <b>Bone marrow aspiration and biopsy</b></li> </ul>	<p><b>CBC and blood smear:</b></p> <ul style="list-style-type: none"> <li>• changes in myeloid cell lines</li> <li>• Elevated LDH, uric acid, and/or leukocyte alkaline phosphatase</li> <li>• Abdominal imaging (e.g.,CT or ultrasound) with hepatosplenomegaly</li> </ul>

## **2-Lymphocytic leukocytosis**

**Is an increase in number of lymphocyte in differential leukocytic count which normally more than (20-30%).**

**# Common causes of lymphocytosis:**

condition	Viral infectin	Pertussis	Hyperthyroidism
<b>clinical features</b>	<ul style="list-style-type: none"> <li>• Fever</li> <li>• Disease -Specific features</li> <li>• Malaise and/or fatigue,myalgias</li> <li>• Symptoms ofURTI (e.g., cough)</li> <li>• Lymphadenopathy</li> <li>• Nausea, vomiting, diarrhea</li> </ul>	<ul style="list-style-type: none"> <li>• Watery nasal discharg</li> <li>• Paroxysmal coughing with high-pitched whooping</li> <li>• <b>Posttussive vomiting</b></li> <li>• Low-grade fever (rare)</li> </ul>	<ul style="list-style-type: none"> <li>• Clinical features of <b>thyrotoxicosis</b></li> <li>• Fatigue</li> <li>• Pretibial myxedema</li> <li>• Graves ophthalmopathy</li> <li>• Hypertension.</li> </ul>
<b>dignostic finding</b>	<ul style="list-style-type: none"> <li>• Often a clinical diagnosis</li> <li>• Antibody detection and/ or viral PCR</li> <li>• Imaging (e.g., CXR)consistent with infection.</li> </ul>	<ul style="list-style-type: none"> <li>• <b>First 4 weeks of symptoms: PCR and/or bacterial culture of nasopharyngeal swab or aspirate sample</b></li> <li>• <b>&gt; 4 weeks of symptoms: pertussis serology.</b></li> <li>• <b>CBC: A lymphocyte count of &gt; 20,000 cells/<math>\mu</math>L is a characteristic Diagnostic finding in infants.</b></li> </ul>	<ul style="list-style-type: none"> <li>• <b>Thyroid function tests:</b> ↓ <b>TSH</b>, ↑ <b>free T4</b></li> <li>• <b>Imaging of the thyroid gland</b></li> </ul>

condition	Acute lymphoblastic leukemia	Chronic lymphocytic leukemia
<p><b>clinical features</b></p>	<ul style="list-style-type: none"> <li>• Sudden onset of symptoms and rapid progression (days to weeks)</li> <li>• Fever, night sweats, unexplained weight loss</li> <li>• Bone pain</li> <li>• Painless lymphadenopathy</li> </ul>	<ul style="list-style-type: none"> <li>• B symptom</li> <li>• repeated infections</li> <li>• hepatomegaly/ splenomegaly</li> <li>• dermatologic symptoms</li> <li>• Painless lymphadenopathy</li> </ul>
<p><b>diagnostic finding</b></p>	<p>CBC and blood smear:</p> <ul style="list-style-type: none"> <li>• Anemia</li> <li>• Thrombocytopenia</li> <li>• &gt; 20% lymphoblasts</li> <li>• Bone marrow aspiration and biopsy.</li> </ul>	<p>CBC and blood smear:</p> <ul style="list-style-type: none"> <li>• Persistent(&gt;3 months) lymphocytosis</li> <li>• Smudge cell</li> <li>• Anemia</li> <li>• Thrombocytopenia</li> <li>• granulocytopenia</li> <li>• flow cytometry</li> <li>• bone marrow aspiration &amp; biopsy</li> </ul>

## 3-Monocytic leukocytosis:

Is an increase number of monocyte in differential leukocytic count which normally (3-8%).

Monocytosis is most commonly caused by bacterial infections.

### #Causes of monocytosis:

#### 1- Infection

- Bacterial(e.g ,TB)
- Fungal
- Viral (e.g , EBV)
- Protozoal infections (e.g ,malaria)

#### 3-Malignancy

- Lymphoma
- Multiple myeloma
- Acute or chronic myelomonocytic leukemia

#### 2-Autoimmune or inflammatory

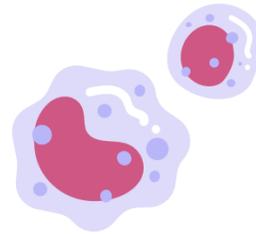

- IBD
- Sarcoidosis
- SLE

#### 4-Hematologic

- Recovery from bone marrow suppression
- Neutropenia

#### 5- Other: splenectomy

# ***Eosinophilic leukocytosis***

Is an increase number of eosinophils in differential leukocytic count which normally (1-5%).

- Usually cause by **Infection , Autoimmune or hypersensitivity** :  
Bacterial (e.g., scarlet fever, leprosy, genitourinary infections, chlamydial infections) and Parasitic infections.  
Asthma, Allergic rhinitis, Eosinophilic esophagitis , Rheumatoid arthritis, SLE and Sarcoidosis .
- Medications: drug hypersensitivity reactions .
- Other Causes by Malignancy , Hematologic , or Dermatological diseases :  
Hodgkin and NH. lymphoma lymphoma , CML , T cel malignancy, Polycythemia vera, Myelofibrosis  
Dermatitis herpetiformis and Erythema multiforme

## **Eosinophilia**

**Mnemonic: ALLERGIC**

@mednotes\_x

- **A** Adrenal insufficiency
- **L** Lymphoma
- **L** L- tryptophan deficiency
- **E** Eczema
- **R** Respiratory causes
- **G** Gastroenteritis
- **I** Infections
- **C** Collagen vascular disease

## ***Basophil leukocytosis***

Basophilia Is an increase number of eosinophils in differential leukocytic count which normally (1-.5%)

Contain heparin and histamine granules , it is become mast cell in tissue

- The usual cause is a **myeloproliferative or haematological** disorder such as chronic myeloid leukemia, Hodgkin lymphoma , polycythaemia vera and Chronic hemolytic anemia
- Reactive basophil increases are sometimes seen during smallpox or chickenpox infection and in ulcerative colitis
- Other Causes such as Allergy , Chronic inflammation of air way or dermatitis , Hypothyroidism , Ovulation and splenectomy .

# ***Leukopenia***

Is a decrease in the white blood cell (**WBC**) count (  $< 4.500/\text{mm}^3$  ).

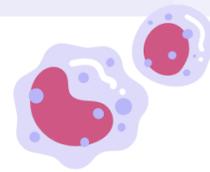

related to a number of that affect WBCs. Or BM :

- Aplastic anemia
- Autoimmune disorders eg. lupus or rheumatoid arthritis.
- Cancer or diseases of the bone marrow eg. MM
- Certain medications eg. antibiotics .
- Cancer treatments : chemotherapy, radiation and bone marrow transplant
- Congenital conditions – Conditions present at birth that affect the bone marrow.

**Kostmann syndrome** : is a rare, severe, congenital neutropenia disorder characterized by a lack of mature neutrophils , it is caused by disabling mutations in the HAX1 gene, which encodes HAX1, a mitochondrial protein that inhibits apoptosis .

**Myelokathexis (WHIM syndrome)** : is a congenital disorder that causes severe, chronic leukopenia and neutropenia , The disorder is believed to be inherited as autosomal dominant manner

# Differential type of leukocytopenia

Condition	Range	cause
<b>Neutropenia</b>	Mild: 1,000–1,500 c/mm <sup>3</sup> Moderate: 500–1,000 c/mm <sup>3</sup> Severe: < 500 c/mm <sup>3</sup> (severe infections )	<ul style="list-style-type: none"> <li>• Genetic conditions As Benign ethnic neutropenia (BEN)</li> <li>• Infections: Commoly HIV, hepatitis, TB , sepsis, and Lyme disease</li> <li>• BM damage/suppression or Drugs e.g. carbimazole, clozapine</li> </ul>
<b>Lymphopenia</b>	<b>&lt; 25%</b> Mild: 800–1,000/mm <sup>3</sup> Moderate: 500–800/mm <sup>3</sup> Severe: <500/mm <sup>3</sup>	<ul style="list-style-type: none"> <li>• Immunodeficiencies e.g., DiGeorge syndrome, SCID, Wiskott-Aldrich syndrome .</li> <li>• immunosuppressants: chemotherapy, glucocorticoids, radiation or Drugs (e.g., carbamazepine).</li> <li>• Infections e.g., sepsis, measles, miliary tuberculosis, HIV.</li> <li>• Neoplasia Hodgkin some NH. lymphomas).</li> </ul>
<b>Monocytopenia</b>	<b>&lt; 3%</b> <200/mm <sup>3</sup> <0.2 × 10 <sup>9</sup> /L	<ul style="list-style-type: none"> <li>• Infections (e.g., HIV, EBV).</li> <li>• Aplastic anemia or Drugs (e.g., glucocorticoids, chemotherapy ).</li> <li>• Malignancy (e.g., hairy cell leukemia, AML)</li> </ul>
<b>Eosinopenia</b>	<b>&lt; 1%</b> <50/mm <sup>3</sup> <0.05 × 10 <sup>9</sup> /L	<ul style="list-style-type: none"> <li>• Infections (typhoid fever, paratyphoid fever, sepsis).</li> <li>• Cushing syndrome.</li> <li>• Glucocorticoids</li> <li>• Stress</li> </ul>

# Clinical Assessment

## History

- Symptoms of infection ( Recent or Recurrent ).
- Symp. Of Malignancies: Night sweats, weight loss, lymphadenopathy suggest leukemia or lymphoma.
- Stress/Physiologic changes: Pregnancy, stress, and exercise can transiently increase WBCs .
- ask about Medications and Autoimmune diseases.

## Physical Examination

- Fever, signs of infection
- Pallor, bruising, fatigue: Possible bone marrow failure
- Sign Lymphadenopathy or hepatosplenomegaly

## Laboratory Investigations

- **Complete Blood Count (CBC)**
- **Peripheral Blood Smear**
- **Bone Marrow Aspiration & Biopsy**
- **Imaging (e.g., CXR in suspected pneumonia).**
- **Additional Tests Based on Clinical Suspicion**

**Table 8.1** White cells: normal blood counts.

Adults	Blood count
<i>Total leucocytes</i>	4.0–11.0 × 10 <sup>9</sup> /L*
Neutrophils	1.8–7.5 × 10 <sup>9</sup> /L*
Eosinophils	0.04–0.4 × 10 <sup>9</sup> /L
Monocytes	0.2–0.8 × 10 <sup>9</sup> /L
Basophils	0.01–0.1 × 10 <sup>9</sup> /L
Lymphocytes	1.5–3.5 × 10 <sup>9</sup> /L

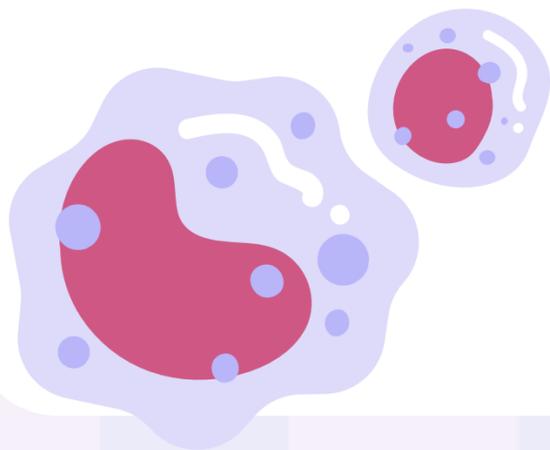

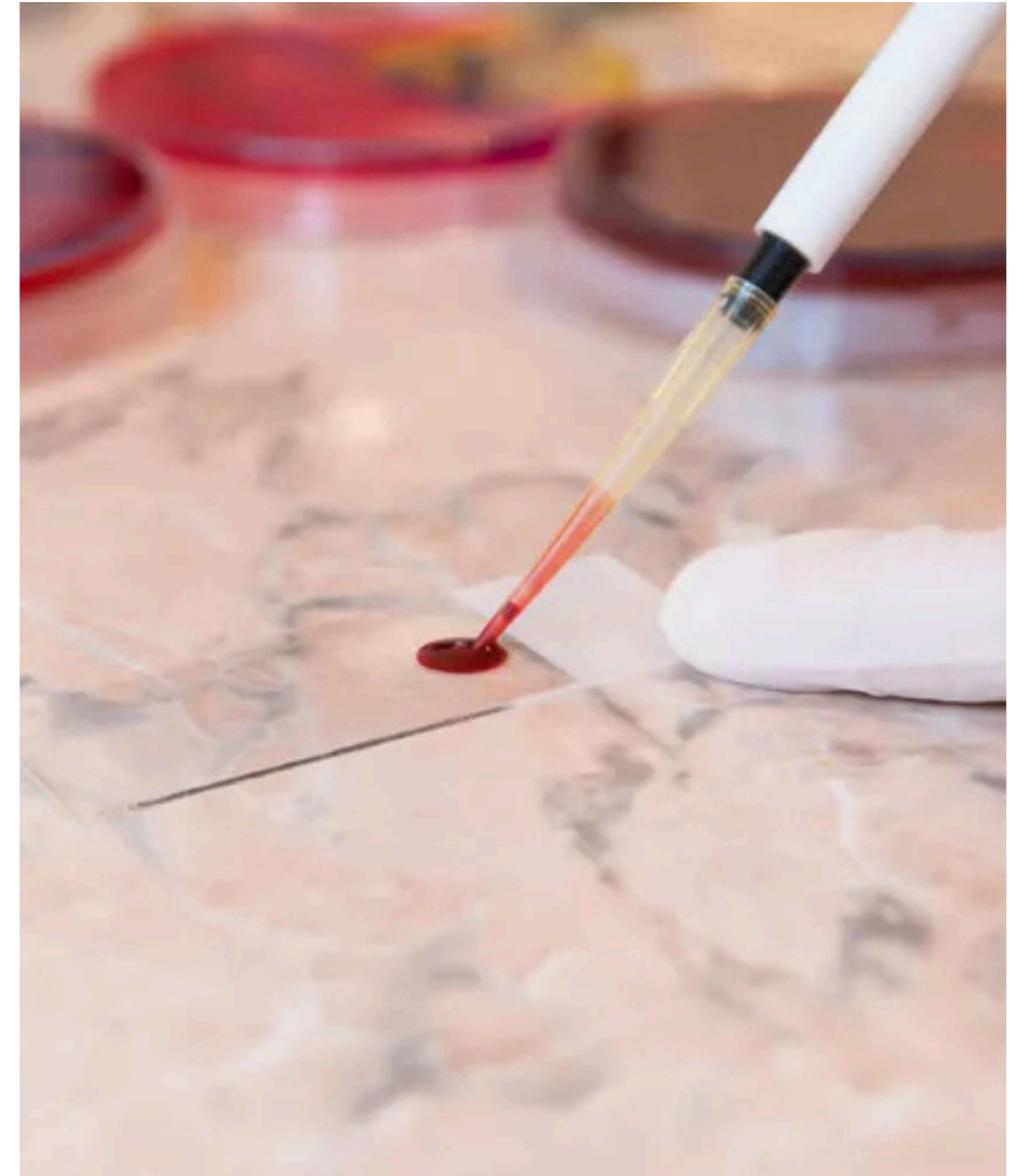

## ***Peripheral Blood Smear Finding :***

- **Morphology**

Monomorphic WBCs are concerning for malignancy.

Pleomorphic WBCs suggest reactive leukocytosis

- **Band cells** are common during the acute phase of bacterial infections and/or inflammation.
- **Platelet clumping** may be misinterpreted as WBCs.
- **Toxic granulations** suggest inflammation..

# ***Treatment***

Supportive Management :

- **Hydration.**

IV fluids to reduce blood viscosity, especially in extreme leukocytosis

- **Manage Complications.**

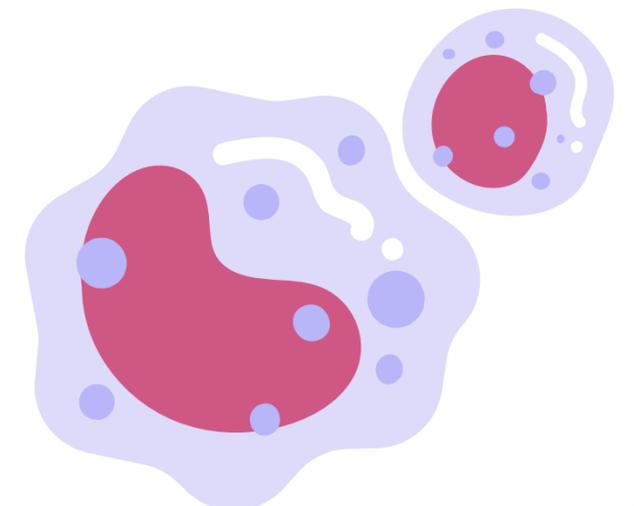

then..

## **Treat the Underlying Cause.**

- Antibiotic or Antiinflammatory .

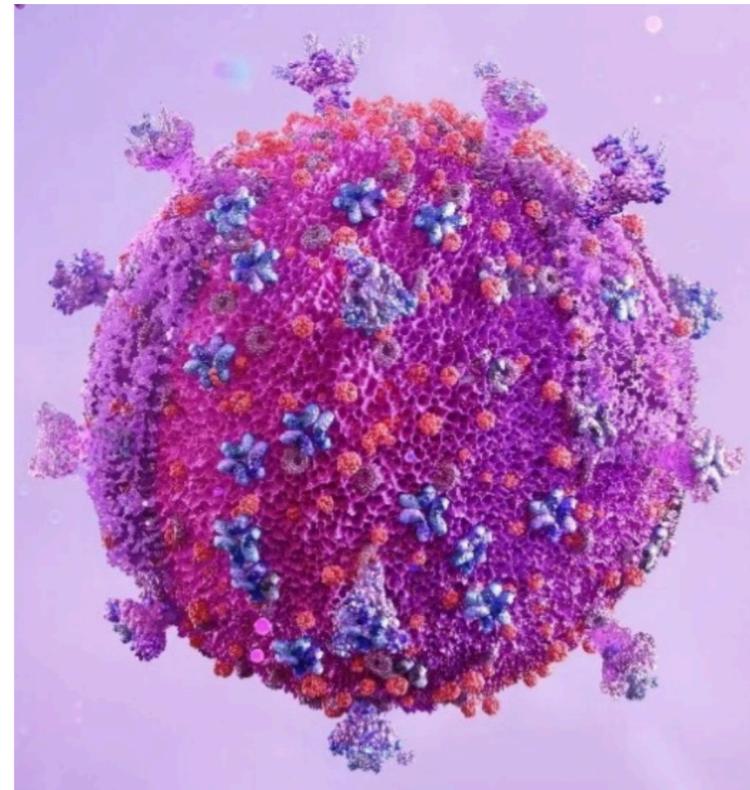

## **Leukemias & Myeloproliferative Disorders.**

- Hematology consultation.
- Chemotherapy or targeted therapy

# *HIV*

- Is lipid Enveloped virus of retroviruses subfamily .
  - Two viral strands of RNA found in core.
- .The virus infects and distrust macrophages and other CD4+ cells .
- Transmission
  - Direct contact with infected blood
  - Sexual contact
  - HIV-infected mothers to infants
- 
- Treatment by Anti-Retroviral therapy

# Thank you...
