

- N-containing molecules
- basic structure building units of proteins
- precursors of biomolecules → neurotransmitters
- utilized as energy source.

$\beta$ -peptides  artificial  
 also used in some antibiotics to counter resistance  
 more stable against proteolytic degradation

biological significance

3 nucleotide = codon  
= 1 amino acid.

# Amino Acid

> 300

$\alpha$   
 $\beta$   
 $\gamma$   
 $\delta$

$\beta$ -amino acid  
with  $\beta$ -alanine.  
is used in plants  
BS microorganism

## proteinogenic amino acid

## Non-proteinogenic amino acids

non protein role  
GABA

protein role  
hydroxyproline

### Non-standard amino acid (3) (non-canonical)

- N-Formylmethionine
  - bacteria
  - chloroplasts
  - mitochondria
- pyrrolysine
  - human X
  - In one type of bacteria.
- selenocysteine
  - the protein which consists of it act in the body as an enzyme.

### Standard amino acid (20)

(canonical) / natural amino acid.

$\alpha$ -amino acids

has secondary amino groups ( $-\text{NH}_2$ )

chiral molecules [chiral C attached to different atoms or groups]

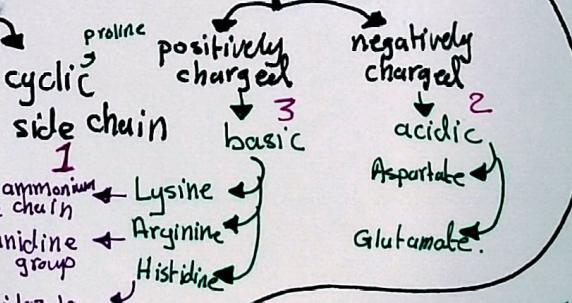

achiral molecules [glycine] 1 carb  
H H N C O H

\* chiral → can't be superposed

+ achiral → can be superposed

The categories of the standard amino acids according to the polarity of the R group

with non-polar R groups 9 with charged polar R groups 5 with uncharged polar R groups 6

aliphatic side chain 6  
Glycine  
simplest side chain: H  
Alanine  
Valine  
Methionine → has a cyclic pyrrolidine side chain  
Leucine  
Isoleucine

aromatic side chain  
tryptophan 2  
phenylalanine  
phenyl group  
Tyrosine  
aromatic  
Tyrosine  
phenolic group  
Serine  
hydroxyl group  
Threonine  
amide group  
Asparagine  
Glutamine  
thiol group  
Cysteine  
cysteine + cystein  
oxidation of 2 thiol groups  
Formation disulfide bond (-S-S-)

### Isomers

molecules  molecular formula  
 chemical structure

constitutional structural  
- atoms &  
functional group  
bind together  
in different ways  
spatial  
different  
in the  
configuration  
of atoms  
than the  
order of  
atomic connectives

### D/L amino acids

enantiomers = stereoisomers  
 mirror images to each other & not superimpose

left  $\alpha$  carbon  
L (laevus)  
amino acids  
+ protein  
at Fischer projection.  
right  $\alpha$  carbon  
D (dexter)  
sugars

representing the structure of chiral molecules  
 carbohydrates  
 amino acids

D-amino acids polypeptide  
 bacterial cell walls  
 to resist digestion by other organism

### optical activity

dextrorotatory  
enantiomer rotates the light clockwise

enantiomer rotates the light clockwise

(+) (+)

(-) (-)

\* D/L doesn't confuse with +/- system  
D/L system  
Racemic mixture → contain equal amounts of enantiomers

## Amino Acids

Nutritional classification

Essential amino acid

can't be produced by the body.

must be supplied through diet

Valine

Isoleucine

Leucine

Lysine

Methionine

phenylalanine

Threonine

Tryptophan

Non-essential amino acid

Can be synthesized by the body.

Glycine

Alanine

Serine

Cysteine

Aspartic acid

Glutamic acid

Asparagine

Glutamine

Proline

Conditionally essential amino acid.

synthesized in the body in insufficient amount  
should be supplied in diet

[requirement] production rate  
essential in cases:

children  
pregnant  
lact

Histidine

Arginine

Tyrosine

\* phenylalanine → tyrosine

diet is deficient in phenylalanine  
individual is deficient in enzyme

required to convert [Ph → T]

**Amphoteric property of Amino Acids**

ampholytes  $\xrightarrow{[-\text{COOH}]}$   $\xrightarrow{[-\text{NH}_2]}$   
ionization  $\rightsquigarrow$  pH value.

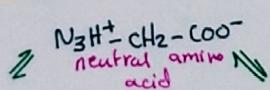

accumulated phenylalanine  
is toxic

toxic to brain

lead to intellectual disability & mental disorders

pH  $\alpha_1$   $\left[\frac{1}{4}\right]$

Glycine  $\rightarrow$

Ionized low pH cation

$\text{NH}_3^+$

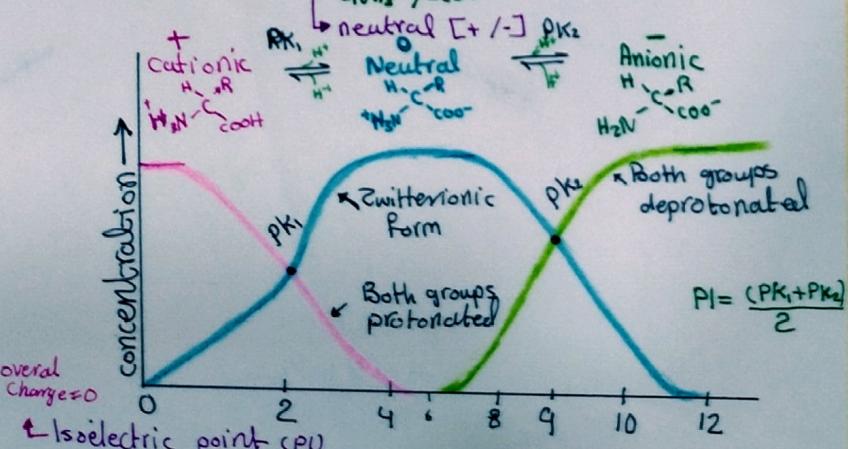

$\text{CH}_2$

$\text{COOH}$

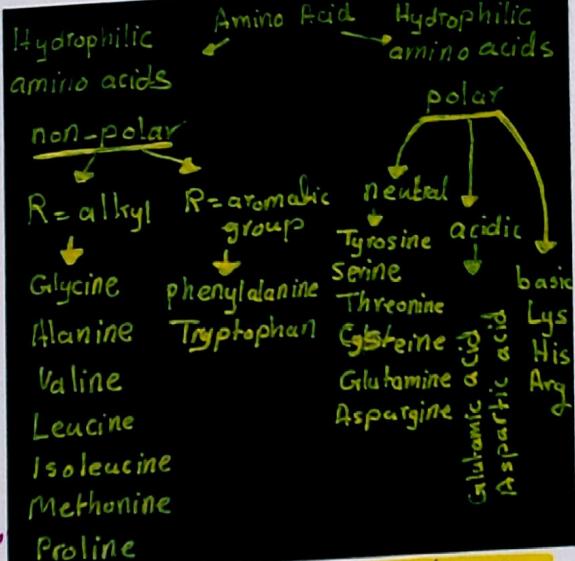

$\text{NH}_2 - \text{CH}_2 - \text{COO}^-$

ionized high pH anion

\* Amino Acids as [Zwitterions] [dipolar molecules]

the pH at which molecules carry no net electric charge  $\rightsquigarrow$  zwitterion is the dominant form of the amino acids

## Amino Acid Derivatives

non standard/non-proteinogenic amino acids

not found in protein

carnitine

GABA

[neuromitter]

found in proteins formed by

not produced directly by standard cellular machinery

hydroxyproline.

post-translational modification

Glycosylation

[addition of sugar moieties]

Stabilize protein

conformation

direct selected

proteins to

various intercellular

organelles

[targeting process]

Carboxylation

of glutamate

& proline

proteins involved

in blood-clotting

cascade

better binding

of Ca<sup>2+</sup> cations

collagen protein

maintaining connective

tissue

phosphorylation

of serine

threonine

tyrosine

introduces -charge

alter the activity of

protein/enzyme

## Non protein Function.

\* non-standard intermediate in the metabolic pathway  $\rightarrow$  standard

Urea cycle part of amino acid catabolism

amino acids synthesize

Examples

Tryptophan

Tyrosine

Histidine

Glutamate

amino acid derivatives

molecules

serotonin

thyroxin

histamine

GABA

Lornithine & cirtulline

[part of amino acid catabolism]

catecholamine neurotransmitter

dopamine

adrenaline

noradrenaline

[released during allergy]

major inhibitory

NT in brain

decarboxylation

released during allergy

histamine

released during allergy

GABA

[released during allergy]

γ-aminobutyric acid.
