## Chemical Hazards

PROF. DR. WAQAR AL-KUBAISI

23<sup>TH</sup> MARCH 2025

# Chemical Hazards

There is hardly any industry which does not make use of chemicals.

The chemical hazards are on the increase with the introduction of newer and complex chemicals.

❑ The ill-effects produced depend upon the

1. Duration of exposure,
2. The quantum of exposure and
3. individual susceptibility.

❑ Chemical agents act in three ways :

(1) Local Action

(2) Ingestion

(3) Inhalation

Dusts

i) Gases

ii) Metals and Their Compounds

## -1-Local Action: Chemical Hazards\_act

Local action

ingestion:

inhalation :

*dusts*

*gases*

*metals*

Some chemicals cause

- ❑ dermatitis, eczema, ulcers and even cancer
- ❖ by *primary irritant* action;
- some cause dermatitis by an **allergic** action.
- ✓ Occupational dermatitis is a big problem in industry
- ❖ Some compounds are *absorbed* through the skin and
- cause systemic effects. such as TNT and aniline

## -2- Ingestion:

Occupational diseases may also result from

- ❖ ingestion of chemical substances such as lead, mercury, arsenic, zinc, chromium, cadmium, phosphorus etc.
- ❖ Usually these substances are **swallowed in minute amounts** through contaminated hands, food or cigarettes.
- ❖ Much of the ingested material is **excreted through faeces** and only a small proportion may reach the general blood circulation.

## - 3- Inhalation

### (i) Dusts :

Local action  
ingestion:  
*inhalation :*  
*dusts*  
*gases*  
*metals*

- ❖ Dusts are finely divided solid particles
- ❑ with size ranging from **0.1 to 150 microns**.
- ❖ They are released into the atmosphere during **crushing, grinding, abrading, loading and unloading** operations.
- ❖ Dusts are produced in a number of industries **mines, foundry** مسبك **quarry** مقلع, pottery, textile, wood or stone working industries.
- ❑ Dust particles **larger than 10 microns** settle down from the air rapidly, while
- ❑ the **smaller ones remain suspended** indefinitely.
- ❑ Particles **smaller than 5 microns** are **directly inhaled** into the lungs and **retained there**.
- ❖ This type of the dust is called "**respirable dust**", and

- ❖ This type of the dust is called "**respirable dust**", and
- ❖ is mainly **responsible for pneumoconiosis**.

❑ Dusts have been classified into:

- *inorganic* and *organic* dusts;
- *soluble* and *insoluble* dusts.

❑ **The inorganic dusts** are  
silica, mica, coal, **asbestos** dust, etc...

❑ **the organic dusts** are  
cotton, jute ,,,,,

❑ **The soluble dusts**

- ❖ dissolve slowly, enter **the systemic circulation** and are
- ❖ eventually **eliminated** by body metabolism.

❑ **The insoluble dusts**

❑ **remain**, more or less, **permanently in the lungs**.

❖ **They are mainly the cause of pneumoconiosis**.

## (ii) Gases :

Exposure to gases is a common hazard in industries.

Gases are sometimes classified as

- ❖ *simple gases* ; (e.g., oxygen, hydrogen)
- ❖ *asphyxiating gases* ; (e.g. carbon monoxide, cyanide gas, sulphur dioxide, chlorine) and .
- ❖ *anaesthetic gases* (e.g. chloroform, ether, trichlorethylene)

## (iii) Metals and Their Compounds:

- ❑ A large number of metals, and their compounds are used throughout the industry e.g. lead, antimony, arsenic, beryllium, cadmium, cobalt, manganese, mercury, phosphorus, chromium, zinc and others.

❑ The chief mode of entry of

❑ **The chief mode of entry** of some of them

❖ is **by inhalation** as dust or fumes.

❑ **The ill-effects depend upon**

➤ **the duration of exposure and**

➤ **the dose or concentration of exposure.**

❑ **Unlike the pneumoconiosis, most chemical**

❑ **intoxications respond positively to**

■ **cessation of exposure**

■ **and medical treatment.**

# Pneumoconiosis

# Pneumoconiosis

- ❑ Dust within the size range of  $1-5\mu$  is a health hazard
- ❖ after variable period of exposure, producing,
- ❖ a lung disease known as pneumoconiosis,

## Definition

The term pneumoconiosis derives its meaning from the

Greek words: **pneumo** = air and **konis** = dust

- ❑ The International Labour Organization (ILO) define pneumoconiosis as

- ❖ “the accumulation of dust in the lungs and the tissue reactions to its presence”.

**Pneumoconiosis can be defined** as

The non-neoplastic reaction of lungs to inhaled minerals or organic dust and the resultant alteration in their structure

**Pneumoconiosis can be defined** as

- Defined as the **deposition** and lung **reaction** to **the dust** (dust lung diseases).
- The distribution of dust lesion follow **lymphatic** pathways in lung

### Pathogenesis

For clinical pneumoconiosis to develop,  
**3 essential factors** are required:

- 1) **Exposure to specific substance:**
  - **coal**, appear **relatively inert** and may accumulate in considerable amounts with **minimal tissue response**; while
  - **silica** and **asbestos**, have **potent biologic effects**.
- 2) **Particles of appropriate size** to be retained in lung (**1-5 $\mu$** )
- 3) Exposure for a **sufficient length** of time (usually **around 10 years**)

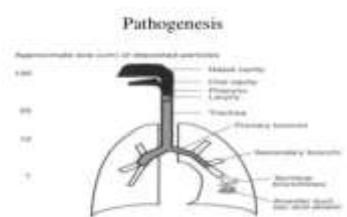

## Pathogenesis

❑ From an **occupational health point of view**,  
**dust is classified by size into** following categories:

### ❖ **Inhalable Dust:**

- is the one which enters the body, but **is trapped** in the nose, throat, and upper respiratory tract.
- Particle size is usually **6-25 $\mu$** .

### ❖ **Respirable Dust:**

- particles that are **small enough to penetrate**  **upper respiratory** system **beyond the body's natural clearance mechanisms** of cilia and mucous and are more likely to be **retained** (maintain) in the lungs.
  - Particle size is usually **1-5 $\mu$** .

❖ Particles of **<1  $\mu$**  are **exhaled out**.

❖ **The hazardous effects of dusts on** the lungs **depend**

# Pathogenesis

Approximate size (um) of deposited particles

❑ The hazardous effects of dusts on the lungs **depend**

❑ upon a number of factors such as:

- (a) Chemical composition
- (b) Fineness
- (c) Concentration of dust in the air
- (d) Period of exposure and
- (e) Health status of the person exposed.

❑ Therefore, the threshold limit values for different dusts are different. .

❑ **In** addition to the toxic effect of the dust on the lung tissues, **the super-imposition of infections** like TB may also influence the pattern of pneumoconiosis

❑ **Pneumoconiosis classification;**

- 1- **caused** by inhalation of inorganic or organic dust
- 2- **severity** spectrum of disease

- Pneumoconiosis **may be caused by** inhalation of inorganic or organic dust

# Pneumoconiosis

64

- Is categorized in two ways:  
1.

Inorganic dusts		Organic dusts	
DUST	DISEASE	DUST	DISEASE
1. Coal	Anthracosis	1. Cane fiber	Bagassosis
2. Silica	Silicosis	2. Cotton dust	Byssinosis
3. Asbestos	Asbestosis	3. Tobacco	Tobacosis
4. Iron	Siderosis	4. Hay/ Grain dust	Farmer's lung

# Pneumoconiosis

65

## 2. - severity spectrum of disease

Classification	Types of pneumoconiosis
1. Major pneumoconiosis	Silicosis, Anthracosis, asbestosis
2. Minor pneumoconiosis	Bagassosis, Byssinosis
3 . Benign pneumoconiosis	Siderosis

## Types

Pneumoconiosis is usually divided into three groups:

- I. Major pneumoconiosis
- II. Minor pneumoconiosis
- III. Benign pneumoconiosis

types

- Pneumoconiosis is usually divided into three groups:

- Major pneumoconiosis

“Fibrotic Pneumoconiosis”

- Minor pneumoconiosis

- Benign pneumoconiosis

- Major pneumoconiosis
- Minor pneumoconiosis
- Benign pneumoconiosis

"Fibrotic Pneumoconiosis"

## III Benign Pneumoconiosis:

- There **isn't any reaction** in the lungs, **but**
- **dust deposition casts** a **shadow in x-ray** of the lung.
- There is **no fibrosis** and
- **no disturbance** of lung functions.
- ❑ They are characterized by the
- ❑ **presence of small rounded dense opacities** on a **chest film** due to perivascular collections of dusts.
- ❑ **The deposits** in the lung **disappear** when exposure is discontinued
  - ❖ It can result from the inhalation of:
    - Iron dust ➡ siderosis
    - Tin dust ➡ stannosis
    - Calcium dust ➡ chalcosis

## II. Minor Pneumoconiosis:

- ❑ Inhalation of some dusts results in “minor fibrosis” of the lungs
- ❖ There is **minimal fibrosis** of the lungs
- ❖ **without interference of lung architecture**
- ❖ or lung **function tests**.
- ❑ These dusts include:
  - Mica pneumoconiosis
  - Koalin (china clay) pneumoconiosis

# • Major Pneumoconiosis: or Complicated pneumoconiosis

- ❖ related to **severity of exposure** ,
- **large lesions**
- + fibrosis (**major fibrosis**)
- + which results in **interference** of lung **architecture** or
- lung **function tests** +
- ❖ lung **collapse** and
- ❖ compensatory **emphysema**.

types

Examples

- ❖ Silica → silicosis
- ❖ Asbestos → asbestosis
- ❖ Coal → anthracosis

- Major Pneumoconiosis: Inhalation of some dusts results in “**major fibrosis**” of the lungs, which results in interference of lung architecture or lung function tests.

- Examples are:

- Silica → silicosis
- Asbestos → asbestosis
- Coal → anthracosis

Healthy lung

Silicotic lung

# Preventive measures in Pneumoconiosis

- ❑ Engineering measures

- ❑ Medical measures

- ❑ Other measures

## ❑ Engineering Measures

- Design of building
- Conduct air monitoring to measure the workers' exposure to such dust .
- Minimize exposures by controlling the creation of airborne for example, use wet drilling, local exhaust ventilation.
- Enclosure / isolation
- Environmental monitoring
- **Prohibit Dry Cutting Promote wet Cutting**

Preventive measures

Prohibit Dry Cutting

Promote wet Cutting

## ❑ Medical measures:

Preventive measures in Pneumoconiosis

- ❑ Medical measures
- ❑ Engineering measures
- ❑ Other measures

Preventive measures

Prohibit Dry Cutting

Promote wet Cutting

- Pre-placement examination
- Periodical examination
- Medical and health care services
- Notification
- Maintenance and analysis of records
- Health education and counselling
- Practicing good personal hygiene
- ✓ **Washing hands** and face before eating, drinking, smoking or use toilet,
- ✓ **Prevent** eat, drink, smoke, in areas where such dust is being used.
- ✓ **Wear protective clothes** and respiratory protection
- ✓ **Before leaving work**, shower and change into clean clothes.
- ✓ **Leave dusty** clothes at work.

- ☐ Medical measures
- ☐ Engineering measures
- ☒ Other measures

## ☒ Other Measures:

### Legal measures:

- Measures to **minimize** dust **emissions and exposure** to dust.
- Law compliance mechanisms, including **effective workplace inspection systems**
- **Cooperation** between **management and workers** and their representatives
- A mechanism for the **collection and analysis** of data on occupational diseases
- **Training** of **health professionals** in occupational diseases **to diagnose and prevent occupational diseases.**

## Preventive measures

Prohibit Dry Cutting

Promote wet Cutting
