

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

السلام عليكم ورحمة الله وبركاته

Biostatistics

L II

4th July 2022

PROF. DR. WAQAR AL-KUBAISY

This include:

Presentation of data by

1. **Graph and or**
2. **Tables**
3. **Calculation** or numerical summaries, such as **Frequency, Average, Mean, Median, Mode Percentages**

Biostatistics consist of

- 1-Collection of **data** .
- 2-Presentation of **data**
- 3-.Estimation of **data**

Descriptive statistics

Graphical Techniques

- some times table presentation will give some difficulties to the reader especially to non numerical readers
- Picture **speaks lauder** than thousand words .
- Graph have **powerful impact** on the imagination of population .
- **Relationships, Trends** and **Contrasts** are often more
- readily appreciated from diagram than table ..

An important thing is the type of the variable concerned.

Nominal and Ordinal Data

Charting

Pie Chart

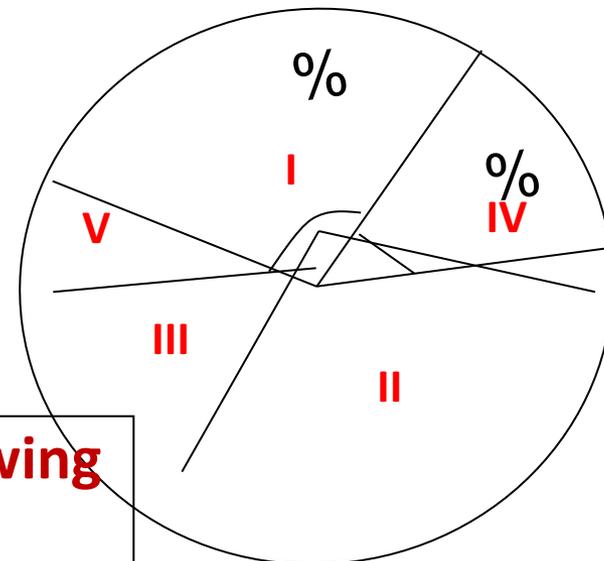

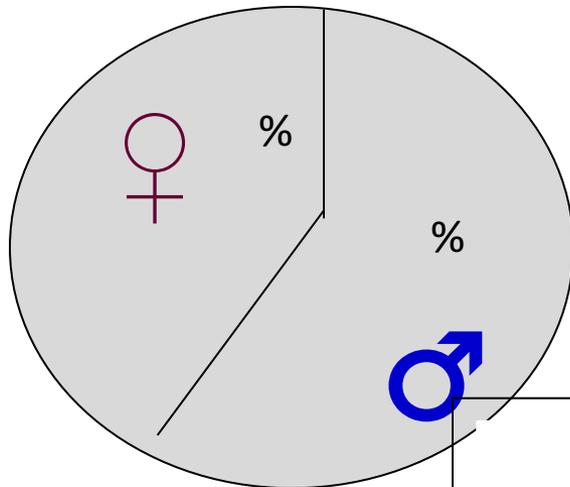

Here the circular is divided into sectors, **pie shaped pieces**

Size of pie proportional to frequency, percentage of that variable.

Disadvantage of pie chart

it can **only** represented **one variable**

(sex of children

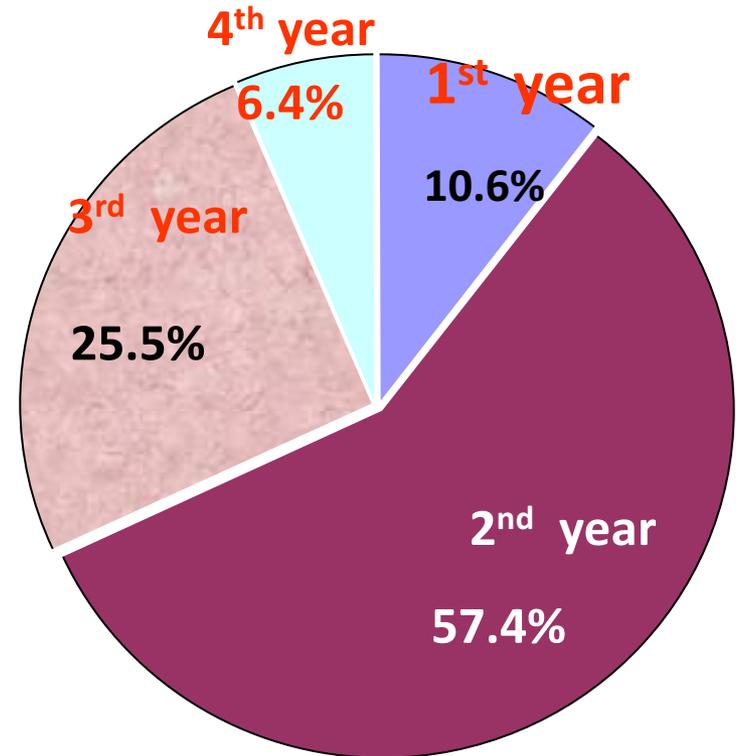

**in showing
comparison**

Pie Charts

- Displays data in percentages.
- Statistics Class Data:
 - 5: 1st year, 10.6%
 - 27: 2nd year, 57.4%
 - 12: 3rd year, 25.5%
 - 3: 4th year, 6.4%
- Should add to 100%, adds to 99.9% due to round-off error

Excellent in showing
part vs. whole comparisons

Percentage of students in each class level in a Statistics class

2- THE BAR CHART:

- This type of graph is suitable to represent data of the **two** subtypes of **qualitative** and **quantitative discrete** type.
- Each category in the table is represented by a **bar** or **column** or **rectangle**,
- So the **height** of the bar is opposite to the corresponding **frequency** on the Y axis.
- All bars must have the **same width** and a **space** must be **left between every two** consecutive bars,
- the **width** of that **space** is about **same or half** the **width** of the **bar**.

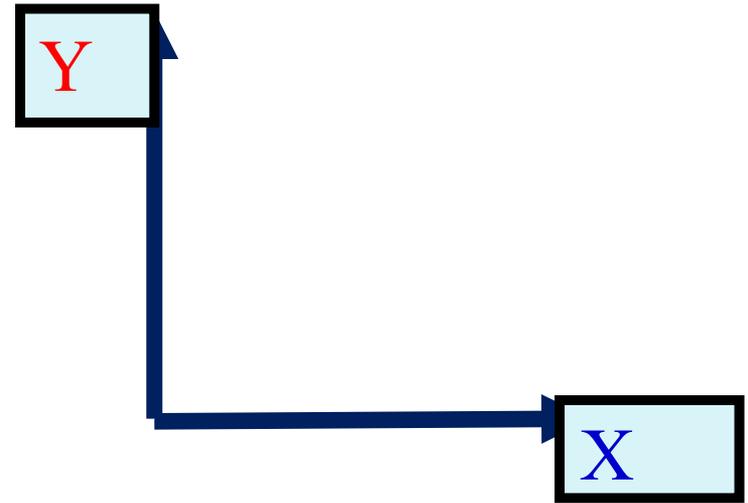

nominal and ordinal data
Bar Chart

Two axis

- **Horizontal, X**
- **plotting the variable .**

- **Vertical, Y**
- **plotting the**
- **frequency, Relative frequency or %**
- **Then draw a Rectangles (bar) .**

The length of rectangle (bar) corresponding to the frequency of the variable

Used for

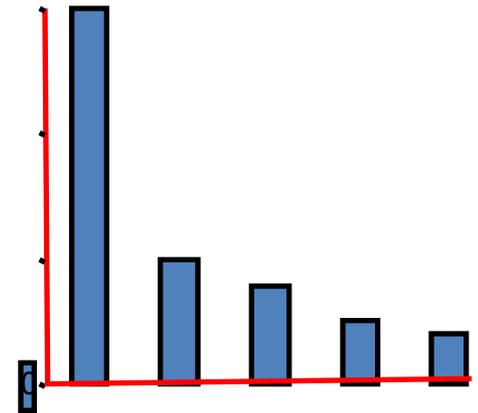

- **frequency or**
- **Relative frequency or**
- **% .**

Charting nominal and ordinal data

Bar chart

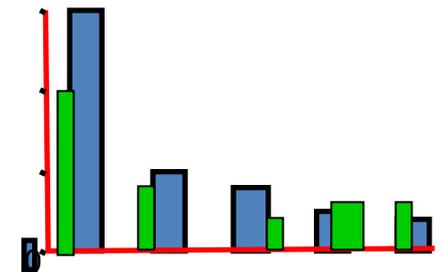

I. Simple bar chart used

- when we have one variable (sex of child)
- width of bares should be equal and
- space between bars be the same

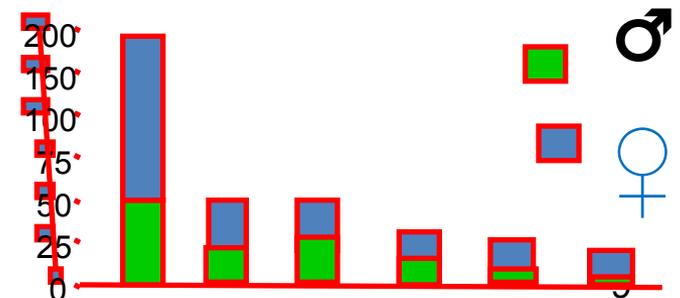

II Clustered bar chart

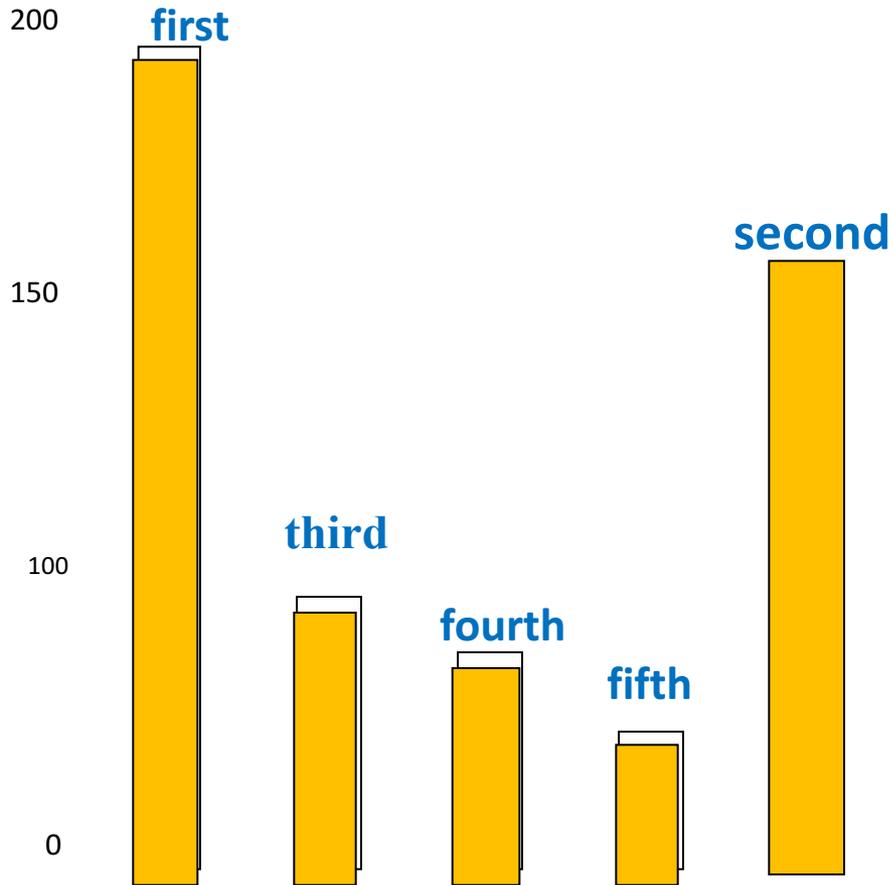

Used when more than one variable example sex with different class year

III Stacked bar chart

nominal and ordinal data

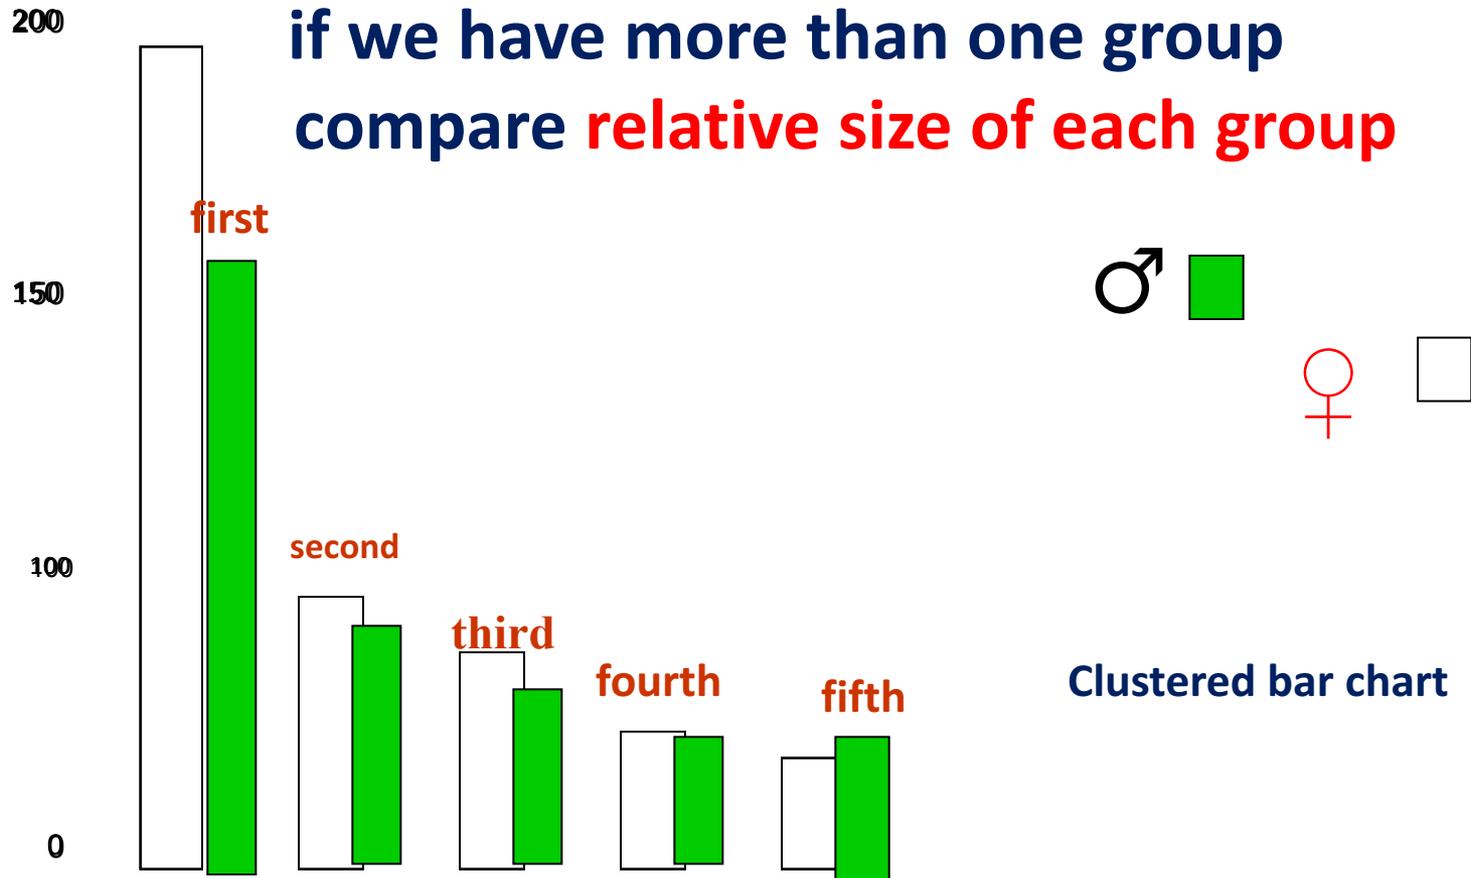

Excellent for showing
Magnitude differences

(I) Mutah medical student according to their year level 2021

7/4/22

nominal and ordinal data

Allows easier comparisons between data sets of different sizes.

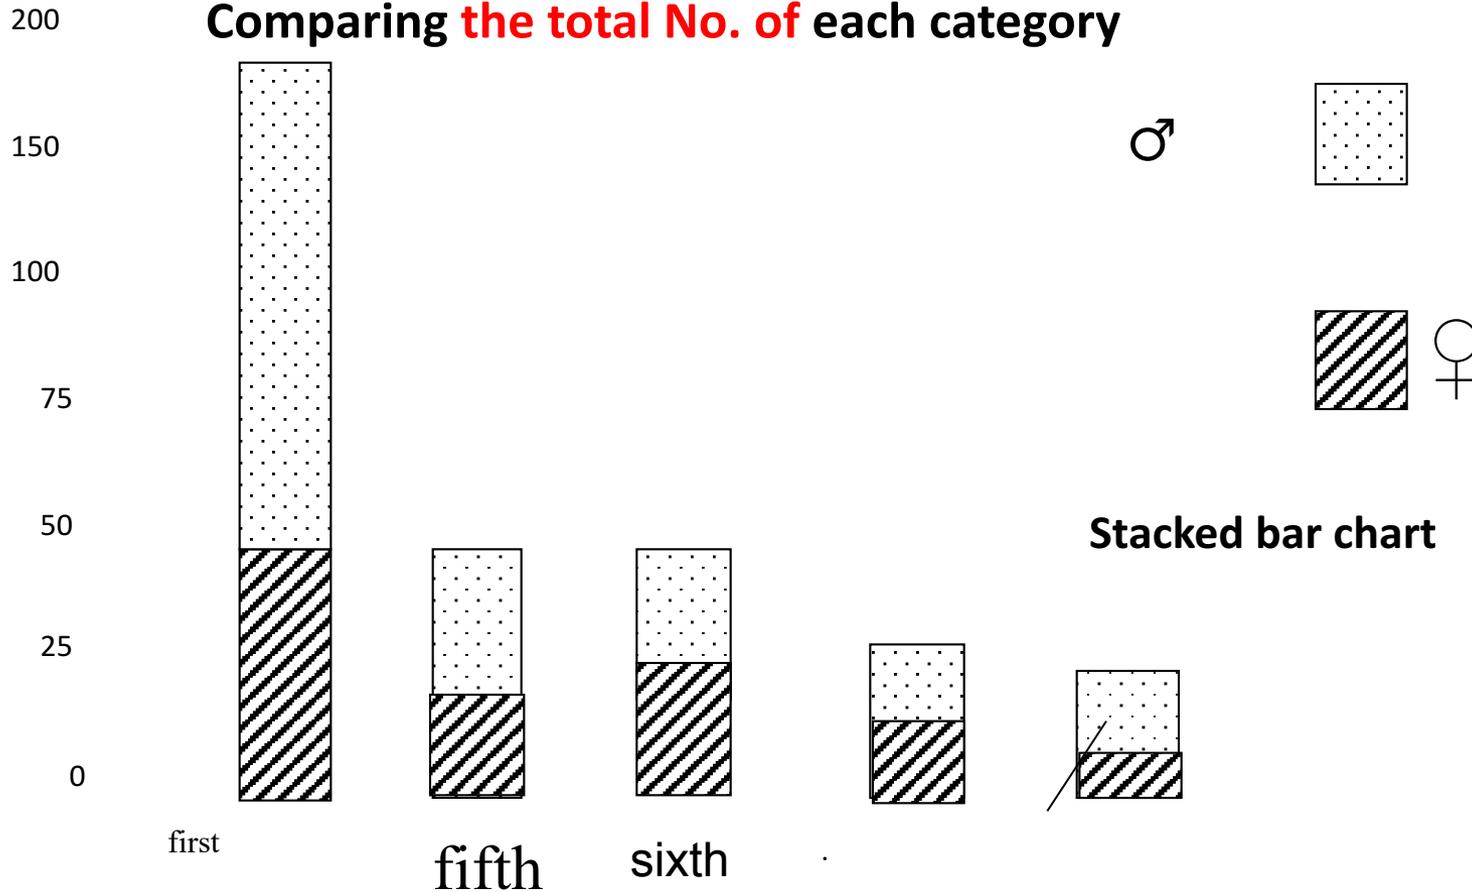

Clustered bar chart

^{first}
(II) Sex distribution of Mutah medical student according to their year level 2021

7/4/22

nominal and ordinal data

Comparing **the total No. of** each category

Stacked bar chart

Sex distribution of Mutah medical student according to their year level 2021

Charting

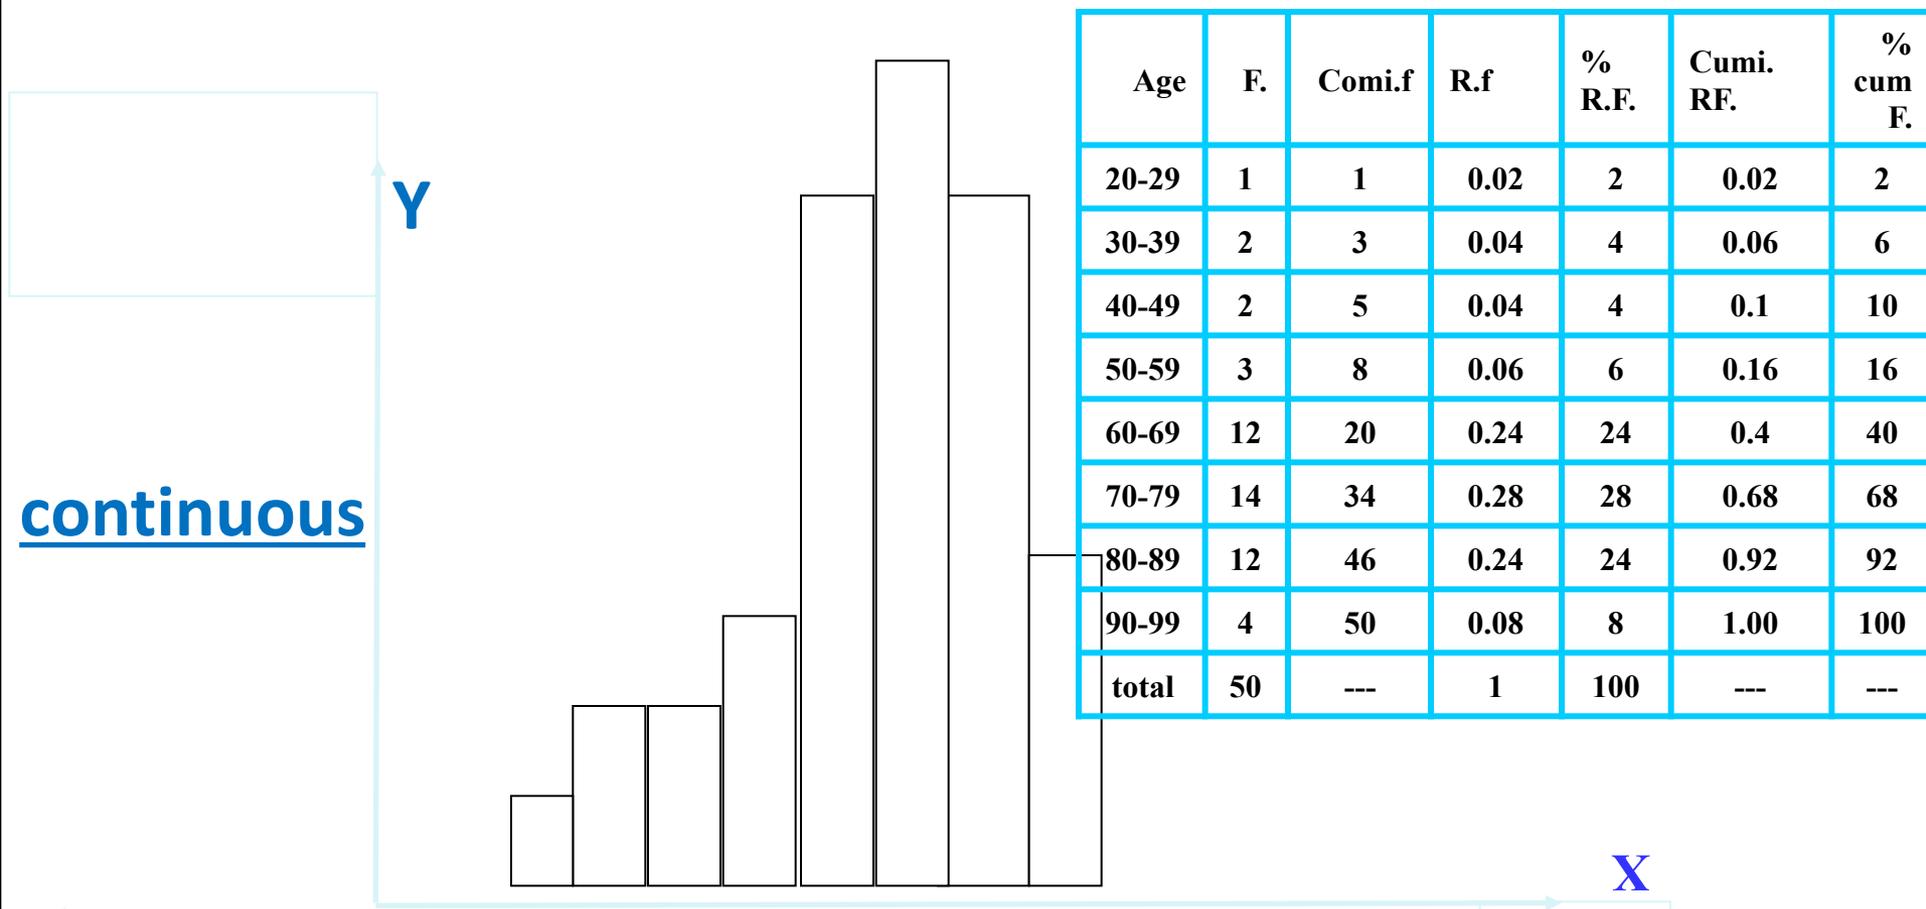

Continuous Metric Variable by

Histogram

| Age (year) | F. | Commut frequenc | Relative frequenc | % R.F. | Cumulat R.F. | %cum Freq. |
|------------|----|-----------------|-------------------|--------|--------------|------------|
| 20-29 | 1 | 1 | 0.02 | 2 | 0.02 | 2 |
| 30-39 | 2 | 3 | 0.04 | 4 | 0.06 | 6 |
| 40-49 | 2 | 5 | 0.04 | 4 | 0.1 | 10 |
| 50-59 | 3 | 8 | 0.06 | 6 | 0.16 | 16 |
| 60-69 | 12 | 20 | 0.24 | 24 | 0.4 | 40 |
| 70-79 | 14 | 34 | 0.28 | 28 | 0.68 | 68 |
| 80-89 | 12 | 46 | 0.24 | 24 | 0.92 | 92 |
| 90-99 | 4 | 50 | 0.08 | 8 | 1.00 | 100 |
| total | 50 | --- | 1 | 100 | --- | --- |

Histogram

The group frequency distribution table usually represented graphically or diagrammatically by **histogram**.

(IV) Age(year) of 50 patients with diabetes Mellitus attending
Al Karak Hospital during march 2022

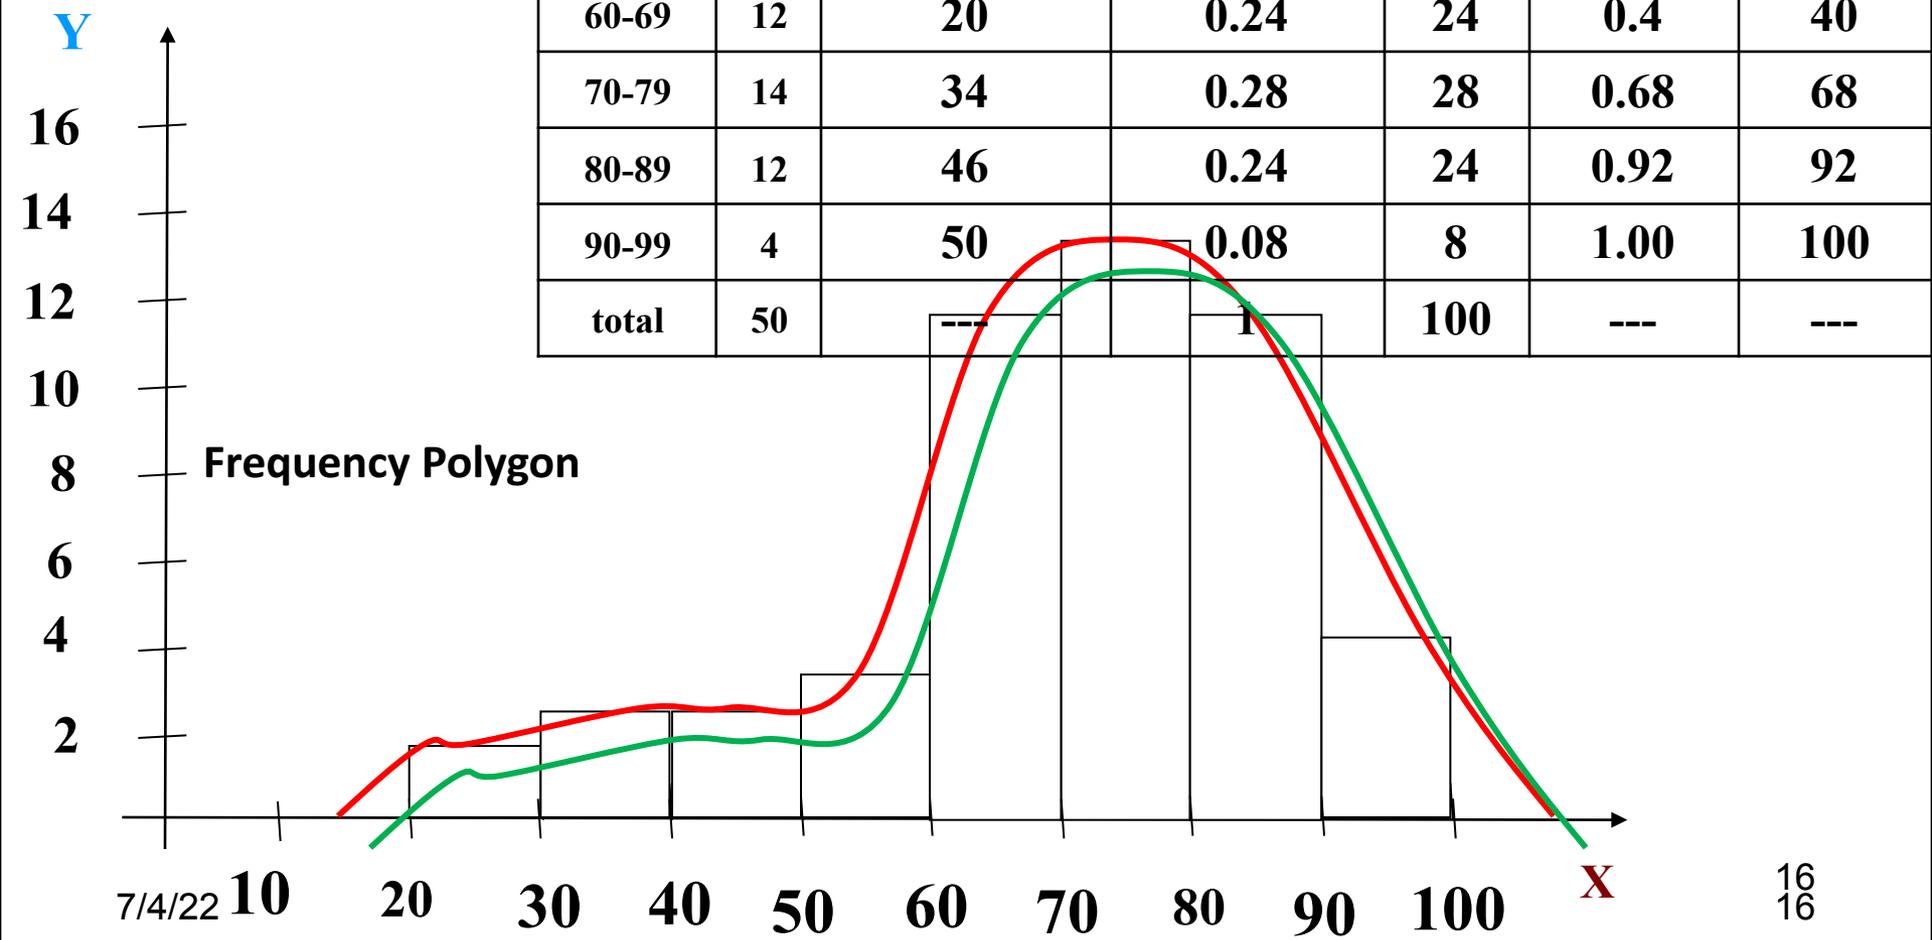

THE FREQUENCY POLYGON:

This type is used when the variable is of **continuous quantitative type** and the table is of simple or complex type.

Each category on the table represented by single point opposite its frequency on Y axis and the mid-point of the interval on X axis.

Then every two consecutive points are joined together by a straight line.

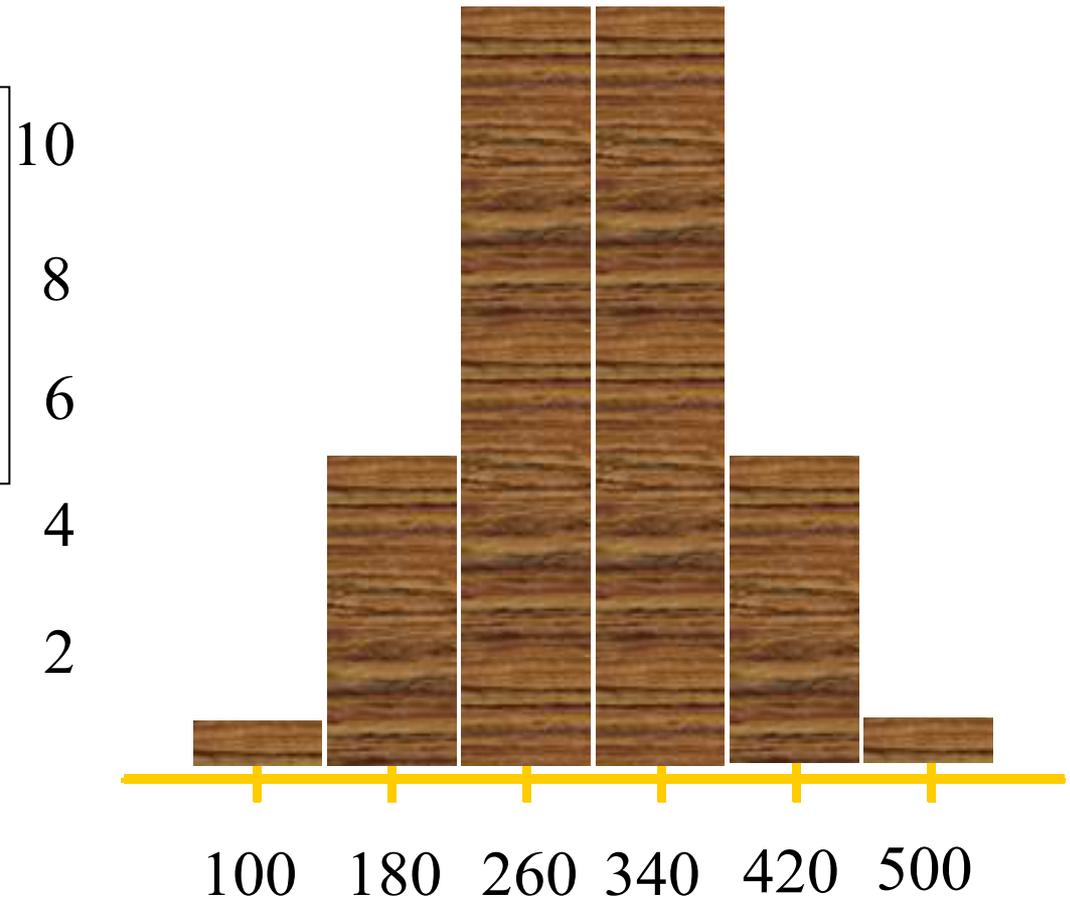

| Age(year) | Freq | Commu.frequ. | Relat.Freque | % R.F. | Cumul. R.F. | %cum.Fre q. |
|-----------|------|--------------|--------------|--------|-------------|-------------|
| 20-29 | 1 | 1 | 0.02 | 2 | 0.02 | 2 |
| 30-39 | 2 | 3 | 0.04 | 4 | 0.06 | 6 |
| 40-49 | 2 | 5 | 0.04 | 4 | 0.1 | 10 |
| 50-59 | 3 | 8 | 0.06 | 6 | 0.16 | 16 |
| 60-69 | 12 | 20 | 0.24 | 24 | 0.4 | 40 |
| 70-79 | 14 | 34 | 0.28 | 28 | 0.68 | 68 |
| 80-89 | 12 | 46 | 0.24 | 24 | 0.92 | 92 |
| 90-99 | 4 | 50 | 0.08 | 8 | 1.00 | 100 |
| total | 50 | | | 100 | --- | --- |

Shapes of Histograms I

Frequency

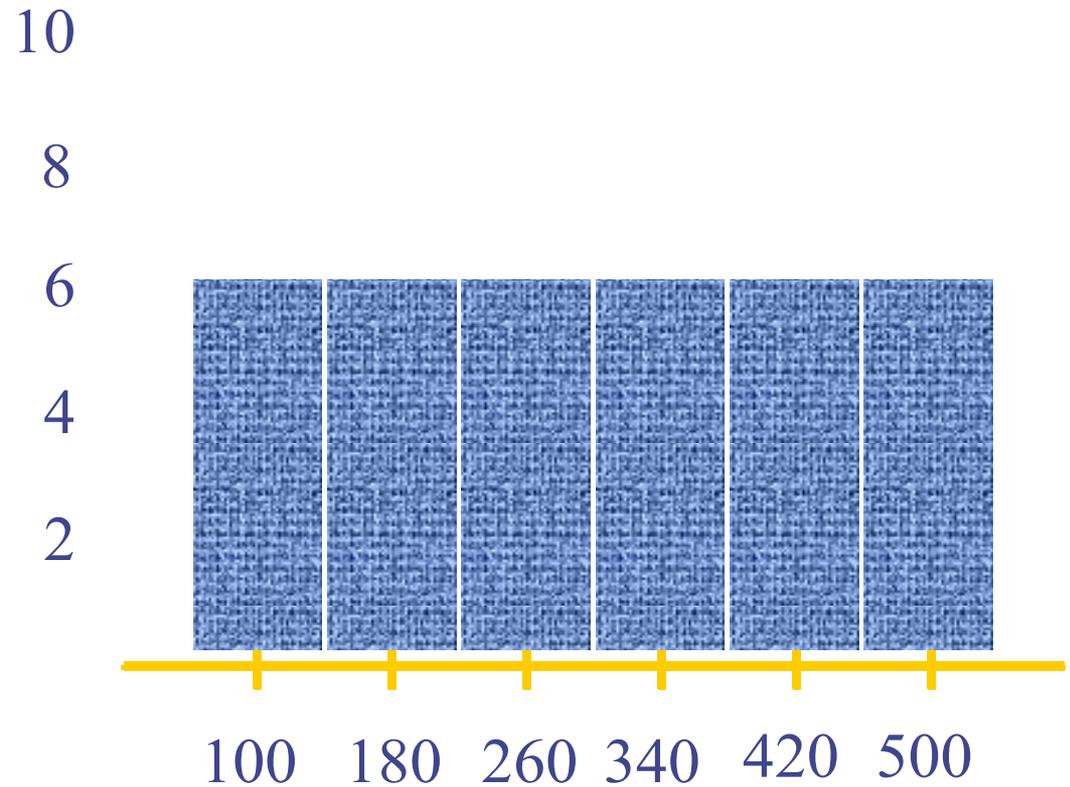

**Symmetrical,
normal,
or bell-shaped**

Shapes of Histograms II

**Uniform
or
rectangular**

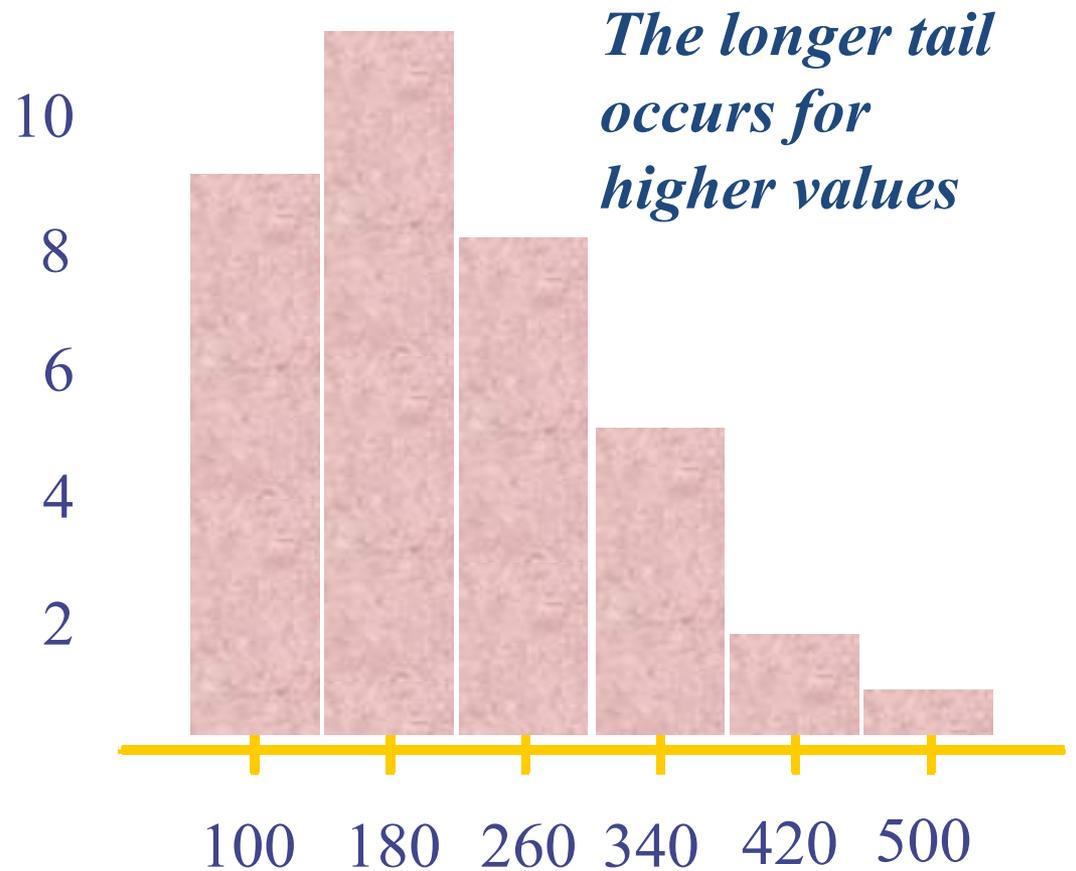

Frequency

Shapes of Histograms III

Frequency

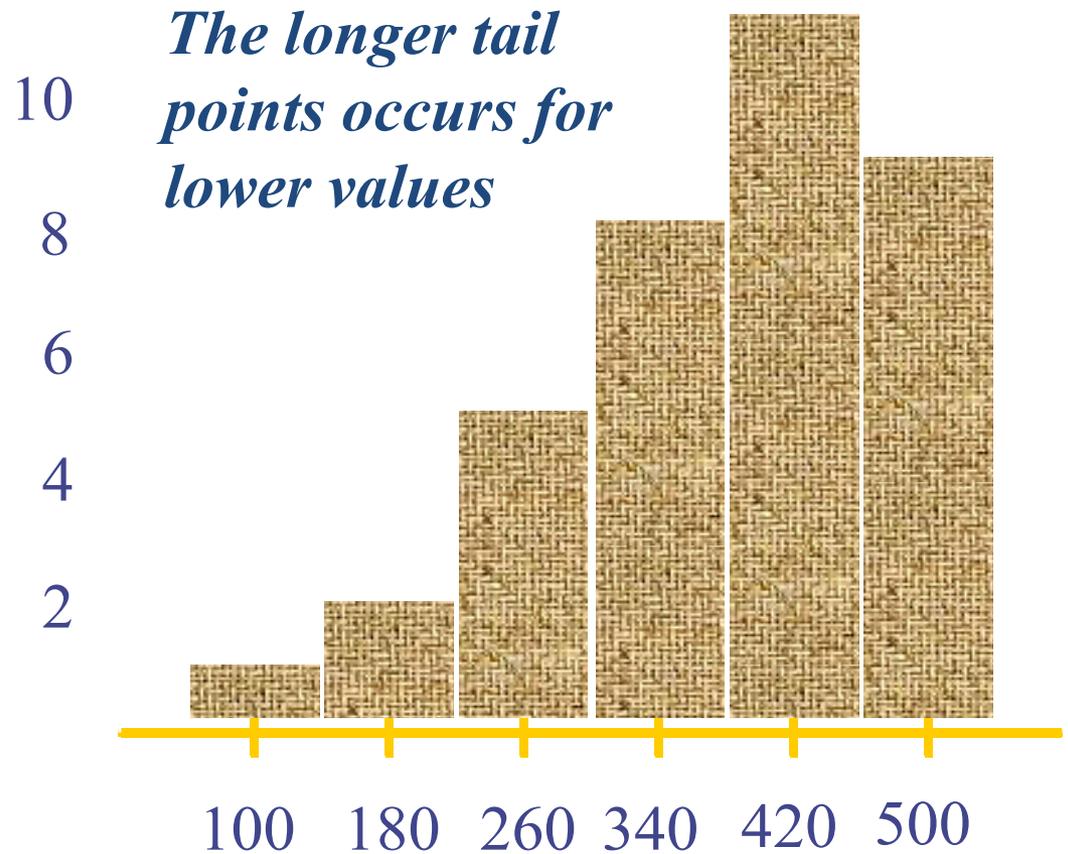

**Skewed right
or
Positively
skewed**

Shapes of Histograms IV

Frequency

**Skewed left
or
Negatively
skewed**

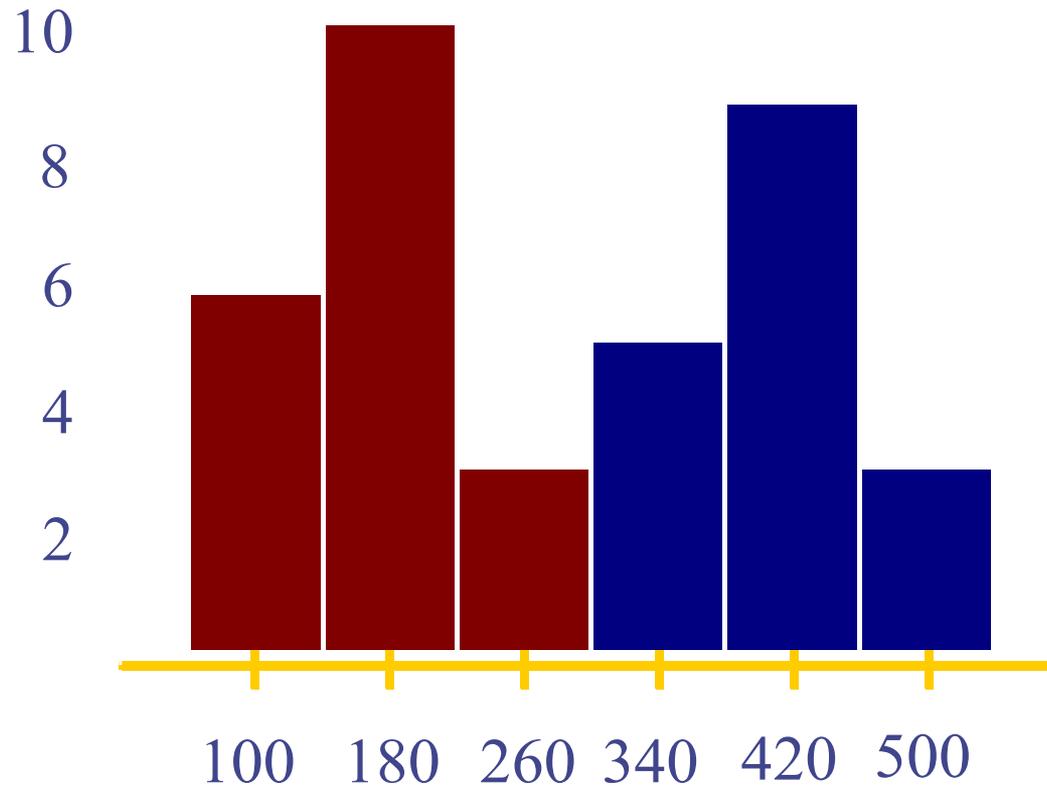

Shapes of Histograms V

Frequency

Peak 1

Peak 2

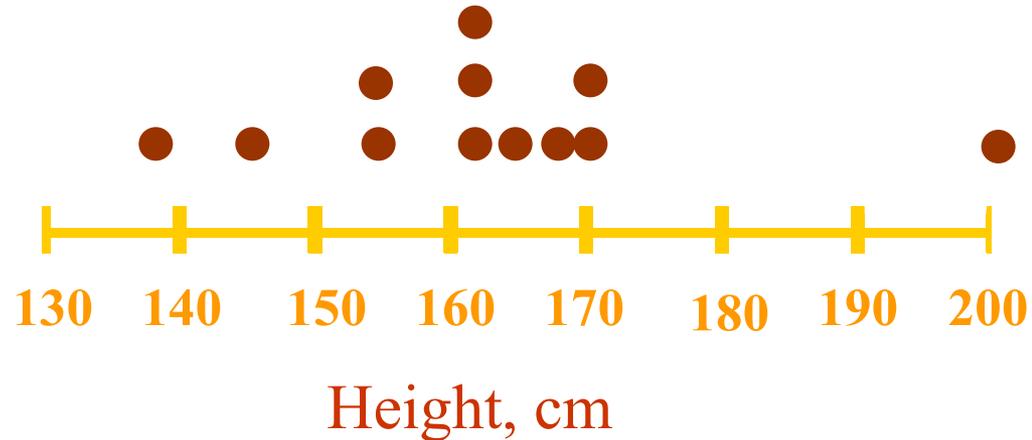

Bimodal

Dotplot

- Number line with dots representing data points
- Can visualize the “spread” of the data
- Data: Height of of 12 female students measured in (cm)

139, 161, 170, 201,
161, 168, 170, 155,
165, 145, 155, 161

THE LINE GRAPH

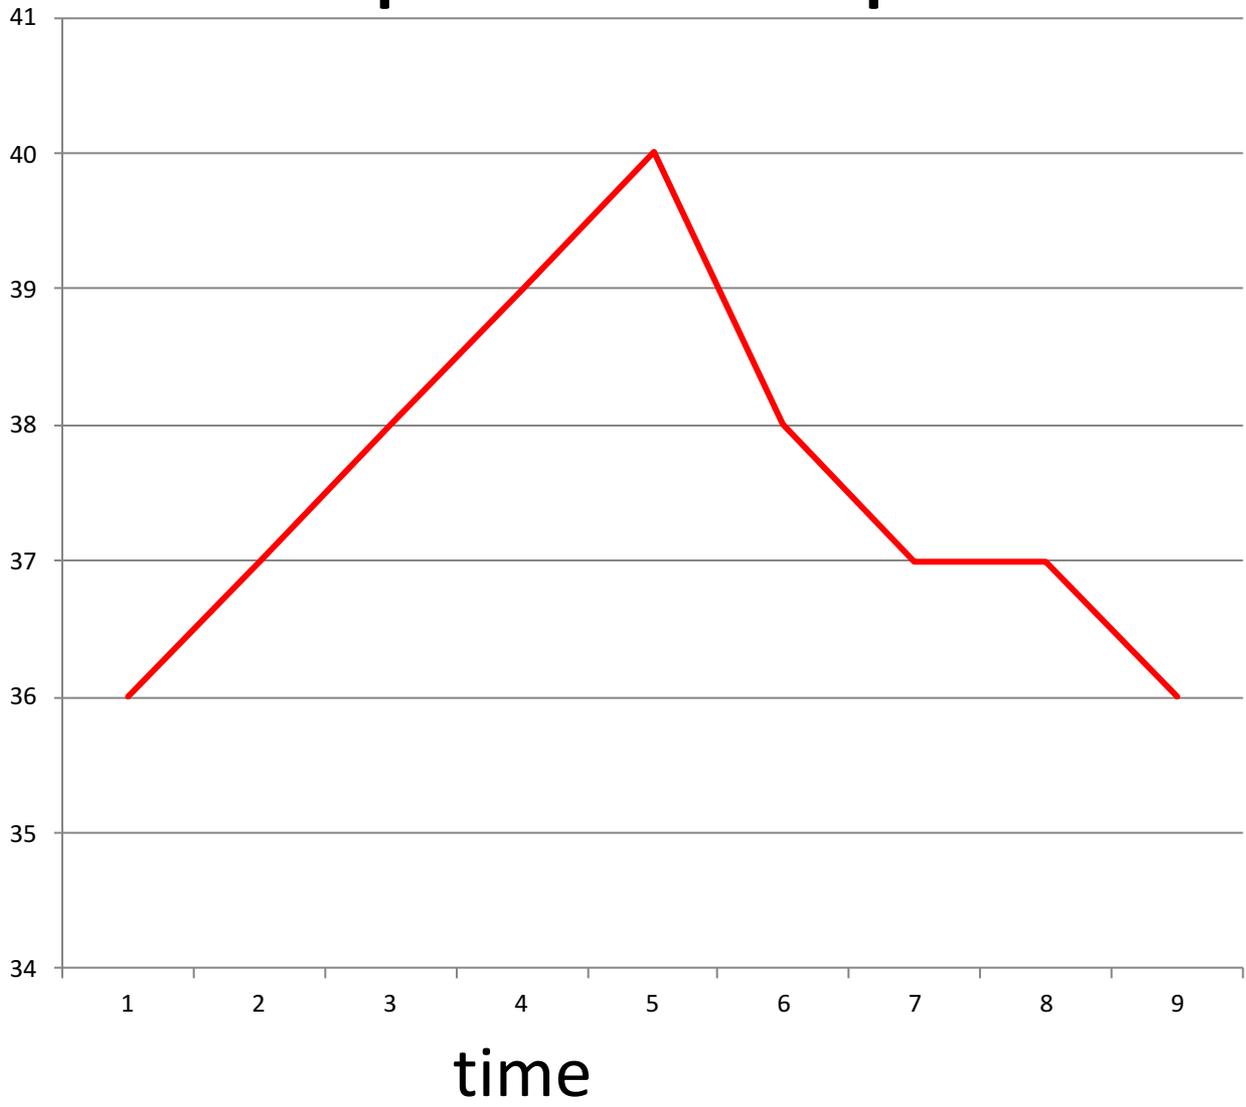

- This type is specifically used when we are dealing with a certain observation that **varies according to time**.
- That is when we are dealing with a time variable.
- (The time variable is a special type of continuous quantitative variable)
- Usually the **time variable** is put on the **horizontal axis (X-axis)** and the **other variable** is put on the vertical axis (**Y-axis**),
 - then each observation is shown on the graph **by means** of a **point opposite** to the **exact time value** on the horizontal axis and opposite the corresponding value on the vertical axis,
 - then every two consecutive points are joined by a straight line.

Example of this is a temperature chart of the patient. It is also used in study of trends of birth and death rate

| Time | temperature |
|------|-------------|
| 1 | 36 |
| 2 | 37 |
| 3 | 38 |
| 4 | 39 |
| 5 | 40 |
| 6 | 38 |
| 7 | 37 |
| 8 | 37 |
| 9 | 36 |

temperature of the patient

temperature

Evaluation of table or graph

Can this table or graph stand alone ?

It should be self explanatory, Through,
Labeling it properly .

Begin with title and carried on through out table or
graph

Title should contain :

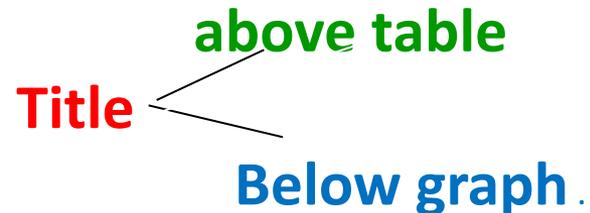

what kind of data is this .

who were involved .

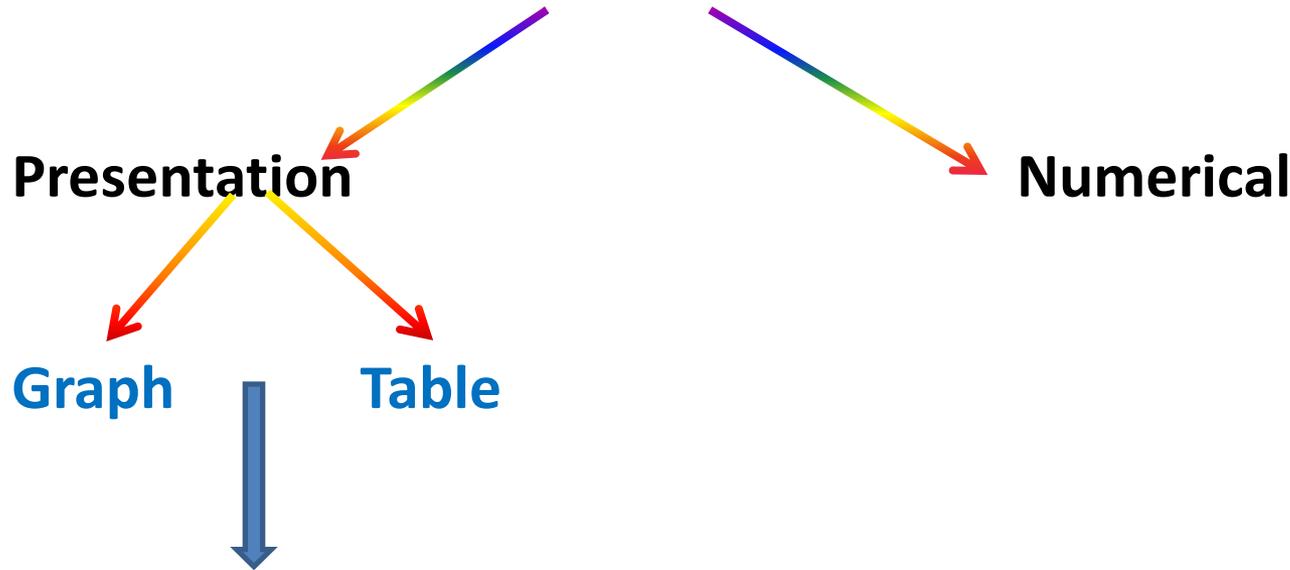

where it was collected .

when it was done .

Foot note may needed.

Description statistics summarization

- *this approach might not be enough,*
- *comparisons* between one set of data & another
- *summarize data by one more step further .*
- *presenting a set of data by a*
- *single Numerical value*

Numerical Presentation

Numerical Description

Measures of Central Tendency
Measures of Dispersion

**The central value as
representative value in a set of data,**

1-Measures of central tendencies (Location) .

A value around which the data has a tendency to congregate (come together)or cluster

2-Measures of Dispersion, scatter around average

A value which measures the degree to which the data are or are not, spread out

-single Numerical value. ??

Are we using largest value ?

Are we using lowest value ?

As a single Number
representation

The central value as
representative value in a set of data,

Measures of Central Tendency

A value around which the data has a tendency to **congregate** or **cluster**

1- Mean

2- Median

3- Mode

4- weighted mean

the choice of the most appropriate measure depends crucially on the type of data involved

Mode (Mo)

- ❖ **Most frequently** occurring value in a set of observation

5 1, 3, 2, 6, 7, 10 5 **?????**

Or

- ❖ the value of observation which has the **highest frequency** in a set of observation .

1 5 1, 3, 1, 2, 6, 7, 10 5 **?????**

- ❖ **Mode is the only measure** of central tendency that can be used for **qualitative data** **???**

- ❖ is **not practically** useful with the **metric continuous** data where no two value may be the same,

- If the observation all having different value

5 1, 3, 2, 6, 7, 10 **?????**

So

the observation all having different value

there is **no Mode** 5 1 3 2 6 .

We might have **one Mode** 5, 1 2, 3, 1, 6 uni modal

We might have more than one Mode

5, 1, 3, 5 7, 3, 6, 2 **Two Mode** Bimodal

5, 1, **3,** **5,** 7, **3,** 6, 2, 1 **Three Mode** Tri modal

5, 1, 3, 5, 7, 3, 6, 2, 1, 3 **???**

Characteristics of Mode

Advantages and Disadvantages

1-Requires no calculation just counting

2- It may not exist (No Mode)

3-It is not necessarily be unique

there may be one mode **unimodal**

more than one mode in a set of data

Bimodal, Tri modal

▪ It is the **only measure** of central tendency that can be used for **qualitative data**

4 -Mode is **not practically** useful with the **metric continuous data**

Median (Md)

It is the **middle value** in **ordered data**
(*from the lowest to the highest values*).

-**Divided the observations into two halves** .

So

- ❖ **1/2** of observation their values **less** than the **value of median**
- ❖ **1/2** of observation their values **More** than the **value of median**
- ❖ Median is located the center of data **by count** and **disregards the size** .
- ❖ Median is thus a measure of centrals

Steps in calculating the median

1- Arrange the value.

From the lowest to the highest value .

Exam. marks

50 10 90 20 40  10 20 40 50 90

2- Find the Median position by this formula

$$\frac{n}{2} \quad \frac{5}{2} \quad 3^{rd}$$

Calculate the value of the third observation = 40 marks .

Odd No. we have just **one median position** .

Even No. we have **two median position** or
two median values

Median value =Average of the two values

Even No 50 10 90 20 40 95

10 20 40 50 90 95

$$\frac{n}{2} = \frac{1}{2} = \frac{6}{2} = \frac{1}{2} = \frac{7}{2} = 3.5$$

Median **located (position)**

between the 3rd and 4th .

Median value = **Average** of the two (3rd and 4th) values

$$Md = \frac{40 + 50}{2} = 45$$

Characteristics

| | | | | | | | | | |
|-----------|-----------|-----------|-----------|-----------|-----------|-----------|------------|--------------|--|
| 10 | 20 | | | | | | | | |
| 20 | 40 | 50 | 90 | 95 | | | | | |
| 10 | 20 | 40 | 50 | 90 | 95 | 99 | 100 | | |

| | | | | | | | | | |
|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|--------------|--|
| 10 | 20 | 40 | 50 | 70 | 85 | 90 | 99 | 100 | |
| 1 | 20 | 40 | 50 | 70 | 85 | 90 | 99 | 100 | |
| 10 | 20 | 40 | 50 | 70 | 85 | 90 | 99 | 1000. | |

two extremes

| | | | | | | | | | |
|-----------|-----------|-----------|-----------|-----------|-----------|------------|--|--|--|
| 15 | 20 | 30 | 35 | 95 | 99 | 100 | | | |
|-----------|-----------|-----------|-----------|-----------|-----------|------------|--|--|--|

skewness

| | | | | | | | | | |
|----------|----------|-----------|-----------|-----------|-----------|-------------|--|--|--|
| 1 | 5 | 10 | 35 | 40 | 99 | 1000 | | | |
|----------|----------|-----------|-----------|-----------|-----------|-------------|--|--|--|

Characteristics of the Median

It is always existed .

- ❖ It is always unique, there is one and only one M_d .
- ❖ It is not affected by two extremes, not sensitive by two extremities .
- ❖ Not affected by skewness in the distribution or
- ❖ Not affected by presence of outliers
- ❖ It is discard a lot of information because it ignores most of the values apart from those in the center of distribution

Mean

$$\bar{X}$$

Arithmetic Mean

- ❖ more commonly known as average
- ❖ -it is an arithmetic average of a set of observation obtained by
 - Adding the values of all observation together .
 - Dividing the sum by No. of observation in sample .
 - *It represent the center of data according to the size of the values .*

Example :

following are the scores of five students

40 50 90 10 20

$$\bar{X} \equiv \frac{\sum X}{N}$$

$$\bar{X} = \frac{\sum X}{N}$$

Σ = sigma = summation .

X = value of observation

N = No. of observation

\bar{X}

= is the sum of value of all observation
divided by the total No. of observation

Characteristics of the Mean

Advantages and disadvantages

- Relatively easy to handle
- It is always exist
- It is always unique,
there is one and only one Mean
- It takes into account every item in a set of data
- It uses all of the information in the data set.
- affected by skewness in the in the data set
- affected by presence of outliers
- it can not be used with the ordinal data ???

➤ It is affected by the two extremes by
a very small or
a very large value .

➤ It is sensitive to the extremes

1 2 3 4 5 mean = 3

1 2 3 4 50 mean = 12

1 2 3 4 500 mean = 102

➤ this may produce a mean that is not very representative of
the general mass of data

another disadvantage ,

➤ it can not be used with the ordinal data ???

(ordinal data are not real numbers,
so they cannot be added or divided)

Weighted mean

It is the average measure of a No. of means, when we take into consideration the frequencies of each mean .
It is used when some values of observation more important in some sense than others .

$$W.mean \quad \frac{W_1 \bar{X}_1 \quad W_2 \bar{X}_2 \quad W_3 \bar{X}_3 \quad \dots \quad W_k \bar{X}_k}{W_1 \quad W_2 \quad W_3 \quad \dots \quad W_k}$$

| Group | \overline{X} Hb | No. of person |
|-------|----------------------|---------------|
| I | 13 | 5 |
| II | 14 | 10 |
| III | 13.5 | 15 |

$$W.mean \quad \frac{5 \quad 13 \quad 10 \quad 14 \quad 15 \quad 13.5}{5 \quad 10 \quad 15} \quad \frac{407.5}{30} \quad 13.5 \text{ gm}/100 \text{ ml}$$

$$\frac{65+140+202.5}{5+10+15} = \frac{407.5}{30} = 13.58$$

Central Tendency In Grouped Data

| Age (year) | F | M.P. | (M.P.)F | Cum. F | % |
|------------|----|------|-----------------|-----------|-----|
| 20-29 | 2 | 24.5 | 24.5 2 = 49 | 2 | 4 |
| 30-39 | 8 | 34.5 | 34.5 8 = 276 | 10 | 16 |
| 40-49 | 5 | 44.5 | 44.5 5 = 222.5 | 15 | 10 |
| 50-59 | 14 | 54.5 | 54.5 14 = 763 | 29 | 28 |
| 60-69 | 15 | 64.5 | 64.5 15 = 967.5 | 44 | 30 |
| 70-79 | 6 | 74.5 | 74.5 6 = 447 | 50 | 12 |
| total | 50 | --- | | --- | 100 |

$$(M.P.)F \quad 2725$$

$$2725/50 = 54.5 \quad \text{years}$$

Choosing the most appropriate measure

(Mean, Median or mode)

How do you chose the most appropriate measure of location in a given set of data ??

The main thing is to remember is that

mean can not be use with the ordinal data (because they are not real numbers

the median can be use for both ordinal & metric data.

the Median can be use for both ordinal & metric data.

**when the later (metric data)
is skewed**

Or

when there is outlier

**the median is
more representative of data than the mean**

????????

| | Mode | Median | Mean |
|-------------------|------------|---|------------|
| Nominal | Yes | No | No |
| Ordinal | Yes | Yes | No |
| Metric discrete | Yes | Yes if distribution is markedly skewed | yes |
| Metric continuous | No | Yes if distribution is markedly skewed | yes |

Thank you ...

**Thank
you**

Any questions?
© Presentation-Process.com

The central value as

1-Measures of central tendencies (Location) .

A value around which the data has a tendency to congregate (come together)or cluster

2-Measures of Dispersion, scatter around average

A value which measures the degree to which the data are or are not , spread out

1-Measures of central tendencies (Location)

75, 75, 75, 75, 75, 75, Mean = ????

75, 70, 75, 80, 85. Mean = ????

60, 65, 55, 70, 75, 75, ,70, 80, Mean= ????

$$\bar{X} = \frac{\sum X}{N}$$

2-Measures of Dispersion,

The central value as

1-Measures of central tendencies

2-Measures of Dispersion,

Measures of Dispersion
(Measures of Variation)
(Measures of Scattering)
measures of spread
